## SIEMENS

## SIMATIC <br> Statement List (STL) for S7-300 and S7-400 Programming

Reference Manual

This manual is part of the documentation package with the order number:
6ES7810-4CA08-8BW1

Edition 03/2003
A5E00706960-01

| Preface, |  |
| :--- | :--- |
| Contents | $\mathbf{1}$ |
| Bit Logic Instructions | $\mathbf{2}$ |
| Comparison Instructions | $\mathbf{3}$ |
| Conversion Instructions | $\mathbf{4}$ |
| Counter Instructions | $\mathbf{5}$ |
| Data Block Instructions | $\mathbf{6}$ |
| Logic Control Instructions | $\mathbf{7}$ |
| Integer Math Instructions | $\mathbf{8}$ |
| Floating-Point Math <br> Instructions | $\mathbf{9}$ |
| Load and Transfer Instructions | $\mathbf{1 0}$ |
| Program Control Instructions | $\mathbf{1 0}$ |
| Shift and Rotate Instructions | $\mathbf{1 1}$ |
| Timer Instructions | $\mathbf{1 2}$ |
| Word Logic Instructions | $\mathbf{1 3}$ |
| Accumulator Instructions | $\mathbf{1 4}$ |

## Safety Guidelines

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring to property damage only have no safety alert symbol. The notices shown below are graded according to the degree of danger.

Danger
indicates that death or severe personal injury will result if proper precautions are not taken.

Warning
indicates that death or severe personal injury may result if proper precautions are not taken.

## Caution

with a safety alert symbol indicates that minor personal injury can result if proper precautions are not taken.

## Caution

without a safety alert symbol indicates that property damage can result if proper precautions are not taken.

## Notice

indicates that an unintended result or situation can occur if the corresponding notice is not taken into account.
If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

## Qualified Personnel

The device/system may only be set up and used in conjunction with this documentation. Commissioning and operation of a device/system may only be performed by qualified personnel. Within the context of the safety notices in this documentation qualified persons are defined as persons who are authorized to commission, ground and label devices, systems and circuits in accordance with established safety practices and standards.

## Prescribed Usage

Note the following:

## 今

## Warning

This device and its components may only be used for the applications described in the catalog or the technical description, and only in connection with devices or components from other manufacturers which have been approved or recommended by Siemens.
Correct, reliable operation of the product requires proper transport, storage, positioning and assembly as well as careful operation and maintenance.

## Trademarks

All names identified by ${ }^{\circledR}$ are registered trademarks of the Siemens AG.
The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

## Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

## Preface

## Purpose

This manual is your guide to creating user programs in the Statement List programming language STL.
The manual also includes a reference section that describes the syntax and functions of the language elements of STL.

## Basic Knowledge Required

The manual is intended for S7 programmers, operators, and maintenance/service personnel.
In order to understand this manual, general knowledge of automation technology is required.

In addition to, computer literacy and the knowledge of other working equipment similar to the PC (e.g. programming devices) under the operating systems MS Windows 2000 Professional, XP Professional or MS Windows Server 2003 are required.

## Scope of the Manual

This manual is valid for release 5.4 of the STEP 7 programming software package.

## Compliance with Standards

STL corresponds to the "Instruction List" language defined in the International Electrotechnical Commission's standard IEC 1131-3, although there are substantial differences with regard to the operations. For further details, refer to the table of standards in the STEP 7 file NORM_TBL.WRI.

## Requirements

To use the Statement List manual effectively, you should already be familiar with the theory behind S 7 programs which is documented in the online help for STEP 7. The language packages also use the STEP 7 standard software, so you should be familiar with handling this software and have read the accompanying documentation.

This manual is part of the documentation package "STEP 7 Reference".
The following table displays an overview of the STEP 7 documentation:

| Documentation | Purpose | Order Number |
| :---: | :---: | :---: |
| STEP 7 Basic Information with <br> - Working with STEP 7, <br> Getting Started Manual <br> - Programming with STEP 7 <br> - Configuring Hardware and Communication Connections, STEP 7 <br> - From S5 to S7, Converter Manual | Basic information for technical personnel describing the methods of implementing control tasks with STEP 7 and the S7-300/400 programmable controllers. | 6ES7810-4CA08-8BW0 |
| STEP 7 Reference with <br> - Ladder Logic (LAD)/Function Block Diagram (FBD)/Statement List (STL) for S7-300/400 manuals <br> - Standard and System Functions for S7-300/400 Volume 1 and Volume 2 | Provides reference information and describes the programming languages LAD, FBD, and STL, and standard and system functions extending the scope of the STEP 7 basic information. | 6ES7810-4CA08-8BW1 |

| Online Helps | Purpose | Order Number |
| :--- | :--- | :--- |
| Help on STEP 7 | Basic information on <br> programming and configuring <br> hardware with STEP 7 in the form <br> of an online help. | Part of the STEP 7 <br> Standard software. |
| Reference helps on STL/LAD/FBD <br> Reference help on SFBs/SFCs <br> Reference help on Organization Blocks | Context-sensitive reference <br> information. | Part of the STEP 7 <br> Standard software. |

## Online Help

The manual is complemented by an online help which is integrated in the software. This online help is intended to provide you with detailed support when using the software.

The help system is integrated in the software via a number of interfaces:

- The context-sensitive help offers information on the current context, for example, an open dialog box or an active window. You can open the contextsensitive help via the menu command Help > Context-Sensitive Help, by pressing F1 or by using the question mark symbol in the toolbar.
- You can call the general Help on STEP 7 using the menu command Help > Contents or the "Help on STEP 7" button in the context-sensitive help window.
- You can call the glossary for all STEP 7 applications via the "Glossary" button.

This manual is an extract from the "Help on Statement List". As the manual and the online help share an identical structure, it is easy to switch between the manual and the online help.

## Further Support

If you have any technical questions, please get in touch with your Siemens representative or responsible agent.
You will find your contact person at:
http://www.siemens.com/automation/partner
You will find a guide to the technical documentation offered for the individual SIMATIC Products and Systems here at:
http://www.siemens.com/simatic-tech-doku-portal
The online catalog and order system is found under:
http://mall.automation.siemens.com/

## Training Centers

Siemens offers a number of training courses to familiarize you with the SIMATIC S7 automation system. Please contact your regional training center or our central training center in D 90327 Nuremberg, Germany for details:
Telephone: +49 (911) 895-3200.
Internet: http://www.sitrain.com

## Technical Support

You can reach the Technical Support for all A\&D products

- Via the Web formula for the Support Request http://www.siemens.com/automation/support-request
- Phone: + 491805050222
- Fax: + 491805050223

Additional information about our Technical Support can be found on the Internet pages http://www.siemens.com/automation/service

## Service \& Support on the Internet

In addition to our documentation, we offer our Know-how online on the internet at: http://www.siemens.com/automation/service\&support
where you will find the following:

- The newsletter, which constantly provides you with up-to-date information on your products.
- The right documents via our Search function in Service \& Support.
- A forum, where users and experts from all over the world exchange their experiences.
- Your local representative for Automation \& Drives.
- Information on field service, repairs, spare parts and more under "Services".

1.13 X( Exclusive Or with Nesting Open ..... 1-12
1.14 XN( Exclusive Or Not with Nesting Open ..... 1-13
1.15 ) Nesting Closed ..... 1-14
$1.16=$ Assign ..... 1-16
1.17 R Reset ..... 1-17
1.18 S Set ..... 1-18
1.19 NOT Negate RLO ..... 1-19
1.20 SET Set RLO (=1) ..... 1-20
1.21 CLR Clear RLO (=0) ..... 1-21
1.22 SAVE Save RLO in BR Register ..... 1-22
1.23 FN Edge Negative ..... 1-23
1.24 FP Edge Positive ..... 1-25
2 Comparison Instructions ..... 2-1
2.1 Overview of Comparison Instructions ..... 2-1
2.2 ? I Compare Integer (16-Bit) ..... 2-2
2.3 ? D Compare Double Integer (32-Bit) ..... 2-3
2.4 ? R Compare Floating-Point Number (32-Bit) ..... 2-4
3 Conversion Instructions ..... 3-1
3.1 Overview of Conversion Instructions ..... 3-1
3.2 BTI BCD to Integer (16-Bit) ..... 3-2
3.3 ITB Integer (16-Bit) to BCD ..... 3-3
$3.4 \quad$ BTD BCD to Integer (32-Bit) ..... 3-4
3.5 ITD Integer (16 Bit) to Double Integer (32-Bit) ..... 3-5
3.6 DTB Double Integer (32-Bit) to BCD ..... 3-6
3.7 DTR Double Integer (32-Bit) to Floating-Point (32-Bit IEEE-FP) ..... 3-7
3.8 INVI Ones Complement Integer (16-Bit). ..... 3-8
3.9 INVD Ones Complement Double Integer (32-Bit) ..... 3-9
3.10 NEGI Twos Complement Integer (16-Bit) ..... 3-10
3.11 NEGD Twos Complement Double Integer (32-Bit) ..... 3-11
3.12 NEGR Negate Floating-Point Number (32-Bit, IEEE-FP). ..... 3-12
3.13 CAW Change Byte Sequence in ACCU 1-L (16-Bit) ..... 3-13
3.14 CAD Change Byte Sequence in ACCU 1 (32-Bit) ..... 3-14
3.15 RND Round ..... 3-15
3.16 TRUNC Truncate ..... 3-16
3.17 RND+ Round to Upper Double Integer ..... 3-17
3.18 RND- Round to Lower Double Integer. ..... 3-18
4 Counter Instructions ..... 4-1
4.1 Overview of Counter Instructions ..... 4-1
$4.2 \quad$ FR Enable Counter (Free) ..... 4-2
4.3 L Load Current Counter Value into ACCU 1 ..... 4-3
4.4 LC Load Current Counter Value into ACCU 1 as BCD ..... 4-4
$4.5 \quad \mathrm{R}$ Reset Counter ..... 4-5
$4.6 \quad$ S Set Counter Preset Value ..... 4-6
4.7 CU Counter Up ..... 4-7
4.8 CD Counter Down ..... 4-8
5 Data Block Instructions ..... 5-1
5.1 Overview of Data Block Instructions ..... 5-1
5.2 OPN Open a Data Block. ..... 5-2
5.3 CDB Exchange Shared DB and Instance DB ..... 5-3
5.4 L DBLG Load Length of Shared DB in ACCU 1 ..... 5-4
5.5 L DBNO Load Number of Shared DB in ACCU 1 ..... 5-4
5.6 L DILG Load Length of Instance DB in ACCU 1 ..... 5-5
5.7 L DINO Load Number of Instance DB in ACCU 1 ..... 5-5
6 Logic Control Instructions ..... 6-1
6.1 Overview of Logic Control Instructions ..... 6-1
6.2 JU Jump Unconditional ..... 6-3
6.3 JL Jump to Labels ..... 6-4

6.13 JN Jump if Not Zero ..... 6-14
6.14 JP Jump if Plus ..... 6-15
6.15 JM Jump if Minus ..... 6-16
6.16 JPZ Jump if Plus or Zero ..... 6-17
6.17 JMZ Jump if Minus or Zero ..... 6-18
6.18 JUO Jump if Unordered ..... 6-19
6.19 LOOP Loop ..... 6-20
7 Integer Math Instructions ..... 7-1
7.1 Overview of Integer Math Instructions ..... 7-1
7.2 Evaluating the Bits of the Status Word with Integer Math Instructions ..... 7-2
$7.3+1$ Add ACCU 1 and ACCU 2 as Integer (16-Bit) ..... 7-3
$7.4 \quad-\quad$ Subtract ACCU 1 from ACCU 2 as Integer (16-Bit) ..... 7-4
7.5 *I Multiply ACCU 1 and ACCU 2 as Integer (16-Bit). ..... 7-5
7.6 II Divide ACCU 2 by ACCU 1 as Integer (16-Bit) ..... 7-6
$7.7+$ Add Integer Constant (16, 32-Bit). ..... 7-8
$7.8+$ D Add ACCU 1 and ACCU 2 as Double Integer (32-Bit) ..... 7-10
7.9 -D Subtract ACCU 1 from ACCU 2 as Double Integer (32-Bit) ..... 7-11
7.10 *D Multiply ACCU 1 and ACCU 2 as Double Integer (32-Bit). ..... 7-12
7.11 ID Divide ACCU 2 by ACCU 1 as Double Integer (32-Bit) ..... 7-13
7.12 MOD Division Remainder Double Integer (32-Bit) ..... 7-15
8 Floating-Point Math Instructions8-1
8.1 Overview of Floating-Point Math Instructions ..... 8-1
8.2 Evaluating the Bits of the Status Word with Floating-Point Math Instruction ..... 8-2
8.3 Floating-Point Math Instructions: Basic ..... 8-3
8.3.1 $+\mathrm{R} \quad$ Add ACCU 1 and ACCU 2 as a Floating-Point Number (32-Bit IEEE-FP) ..... 8-3
8.3.2 $\quad-\mathrm{R}$ Subtract ACCU 1 from ACCU 2 as a Floating-Point Number (32-Bit IEEE-FP) ..... 8-5
8.3.3 *R Multiply ACCU 1 and ACCU 2 as Floating-Point Numbers (32-Bit IEEE-FP) ..... 8-7
8.3.4 /R Divide ACCU 2 by ACCU 1 as a Floating-Point Number (32-Bit IEEE-FP) ..... 8-8
8.3.5 ABS Absolute Value of a Floating-Point Number (32-Bit IEEE-FP) ..... 8-9
8.4 Floating-Point Math Instructions: Extended ..... 8-10
8.4.1 SQR Generate the Square of a Floating-Point Number (32-Bit) ..... 8-10
8.4.2 SQRT Generate the Square Root of a Floating-Point Number (32-Bit) ..... 8-11
8.4.3 EXP Generate the Exponential Value of a Floating-Point Number (32-Bit) ..... 8-12
8.4.4 LN Generate the Natural Logarithm of a Floating-Point Number (32-Bit) ..... 8-13
8.4.5 SIN Generate the Sine of Angles as Floating-Point Numbers (32-Bit) ..... 8-14
8.4.6 COS Generate the Cosine of Angles as Floating-Point Numbers (32-Bit) ..... 8-15
8.4.7 TAN Generate the Tangent of Angles as Floating-Point Numbers (32-Bit) ..... 8-16
8.4.8 ASIN Generate the Arc Sine of a Floating-Point Number (32-Bit) ..... 8-17
8.4.9 ACOS Generate the Arc Cosine of a Floating-Point Number (32-Bit) ..... 8-18
8.4.10 ATAN Generate the Arc Tangent of a Floating-Point Number (32-Bit) ..... 8-19
9 Load and Transfer Instructions ..... 9-1
9.1 Overview of Load and Transfer Instructions ..... 9-1
9.2 L Load ..... 9-2
9.3 L STW Load Status Word into ACCU 1 ..... 9-4
9.4 LAR1 Load Address Register 1 from ACCU 1 ..... 9-5
9.5 LAR1 <D> Load Address Register 1 with Double Integer (32-Bit Pointer). ..... 9-6
9.6 LAR1 AR2 Load Address Register 1 from Address Register 2 ..... 9-7
9.7 LAR2 Load Address Register 2 from ACCU 1 ..... 9-7
9.8 LAR2 <D> Load Address Register 2 with Double Integer (32-Bit Pointer) ..... 9-8
9.9 T Transfer ..... 9-9
9.10 T STW Transfer ACCU 1 into Status Word ..... 9-10
9.11 CAR Exchange Address Register 1 with Address Register 2 ..... 9-11
9.12 TAR1 Transfer Address Register 1 to ACCU 1 ..... 9-11
9.13 TAR1 <D> Transfer Address Register 1 to Destination (32-Bit Pointer). ..... 9-12
9.14 TAR1 AR2 Transfer Address Register 1 to Address Register 2 ..... 9-13
9.15 TAR2 Transfer Address Register 2 to ACCU 1 ..... 9-13
9.16 TAR2 <D> Transfer Address Register 2 to Destination (32-Bit Pointer). ..... 9-14
10 Program Control Instructions ..... 10-1
10.1 Overview of Program Control Instructions. ..... 10-1
10.2 BE Block End ..... 10-2
10.3 BEC Block End Conditional ..... 10-3

## 1 Bit Logic Instructions

### 1.1 Overview of Bit Logic Instructions

## Description

Bit logic instructions work with two digits, 1 and 0 . These two digits form the base of a number system called the binary system. The two digits 1 and 0 are called binary digits or bits. In the world of contacts and coils, a 1 indicates activated or energized, and a 0 indicates not activated or not energized.

The bit logic instructions interpret signal states of 1 and 0 and combine them according to Boolean logic. These combinations produce a result of 1 or 0 that is called the "result of logic operation" (RLO).

Boolean bit logic applies to the following basic instructions:

- A And
- AN And Not
- O Or
- ON Or Not
- X Exclusive Or
- XN Exclusive Or Not
- O And before Or

You can use the following instructions to perform nesting expressions:

- A( And with Nesting Open
- AN( And Not with Nesting Open
- O( Or with Nesting Open
- ON( Or Not with Nesting Open
- X( Exclusive Or with Nesting Open
- XN( Exclusive Or Not with Nesting Open
- ) Nesting Closed

You can terminate a Boolean bit logic string by using one of the following instructions:

- = Assign
- R Reset
- S Set

You can use one of the following instructions to change the result of logic operation (RLO):

- NOT Negate RLO
- SET Set RLO (=1)
- CLR Clear RLO (=0)
- SAVE Save RLO in BR Register

Other instructions react to a positive or negative edge transition:

- FN Edge Negative
- FP Edge Positive

### 1.2 A And

## Format

## A <Bit>

| Address | Data type | Memory area |
| :--- | :--- | :--- |
| <Bit> | BOOL | $\mathrm{I}, \mathrm{Q}, \mathrm{M}, \mathrm{L}, \mathrm{D}, \mathrm{T}, \mathrm{C}$ |

## Description

A checks whether the state of the addressed bit is "1", and ANDs the test result with the RLO.

## Status Word Bit Checks:

The AND instruction can also be used to directly check the status word by use of the following addresses: $==0,<>0,>0,<0,>=0,<=0, O V, O S, U O, B R$.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | $x$ | $x$ | $x$ | 1 |

## Example

| STL Program |  | Relay Logic |  |
| :---: | :---: | :---: | :---: |
| Power rail |  |  |  |
| A | 11.0 | I 1.0 signal state 1 | NO contac |
| A | 11.1 | 11.1 signal state 1 | NC contac |
| $=$ | Q 4.0 | Q 4.0 signal state 1 | Coil |
| $\dagger$ Displays closed switch |  |  |  |

### 1.3 AN And Not

## Format

## N <Bit>

| Address | Data type | Memory area |
| :--- | :--- | :--- |
| $<$ Bit $>$ | BOOL | I, Q, M, L, D, T, C |

## Description

AN checks whether the state of the addressed bit is " 0 ", and ANDs the test result with the RLO.

The AND NOT instruction can also be used to directly check the status word by use of the following addresses: $==0,<>0,>0,<0,>=0,<=0, O V, O S, U O, B R$.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | $x$ | $x$ | $x$ | 1 |

## Example

| STL Program |  | Relay Logic |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Power rail |  |  |
| A | 11.0 | 11.0 <br> Signal state 0 |  | NO contac |
| AN | 11.1 | I 1.1 <br> Signal state 1 | 4 | NC contact |

|  |  |  | $\square$ |  |

## $1.4 \quad 0 \quad$ Or

## Format

## O <Bit>

| Address | Data type | Memory area |
| :--- | :--- | :--- |
| <Bit> | BOOL | $\mathrm{I}, \mathrm{Q}, \mathrm{M}, \mathrm{L}, \mathrm{D}, \mathrm{T}, \mathrm{C}$ |

## Description

$\mathbf{O}$ checks whether the state of the addressed bit is "1", and ORs the test result with the RLO.

## Status Word Bit Checks:

The OR instruction can also be used to directly check the status word by use of the following addresses: $==0,<>0,>0,<0,>=0,<=0, O V, O S, U O, B R$.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | $x$ | $x$ | 1 |

## Example

| STL Program |  | Relay Logic |
| :---: | :---: | :---: |
|  |  | Power rail |
| 0 | 11.0 | I 1.0 Signal state 1  <br> No contact I 1.1 Signal state 0 <br> No contact  |
| 0 | 11.1 |  |
| $=$ | Q 4.0 | Q 4.0 Signal state $1 /$ Coil |
|  |  | Displays closed switch |

### 1.5 ON Or Not

## Format

## ON <Bit>

| Address | Data type | Memory area |
| :--- | :--- | :--- |
| <Bit> | BOOL | I, Q, M, L, D, T, C |

## Description

ON checks whether the state of the addressed bit is " 0 ", and ORs the test result with the RLO.
Status Word Bit Checks:
The OR NOT instruction can also be used to directly check the status word by use of the following addresses: $==0,<>0,>0,<0,>=0,<=0, O V, O S, U O, B R$.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: |  |  |  |  |  |  |  |  |  |

## Example

| STL Program |  | Relay Logic |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Power rail |  |  |
| 0 | 11.0 | $\begin{aligned} & \hline \text { I1.0 } \\ & \text { Signal state } 0 \end{aligned}$ | NO contact |  |
| ON | 11.1 | I 1.1 <br> Signal state 1 |  | NC contact |
| $=$ | Q 4.0 | $\begin{aligned} & \hline \text { Q } 4.0 \\ & \text { Signal state } 1 \end{aligned}$ | $1$ | Coil |

### 1.6 X Exclusive Or

## Format

```
X<Bit>
```

| Address | Data type | Memory area |
| :--- | :--- | :--- |
| <Bit> | BOOL | I, Q, M, L, D, T, C |

## Description

$X$ checks whether the state of the addressed bit is "1", and XORs the test result with the RLO.

You can also use the Exclusive OR function several times. The mutual result of logic operation is then "1" if an impair number of checked addresses is "1".

Status Word Bit Checks:
The EXCLUSIVE OR instruction can also be used to directly check the status word by use of the following addresses: $==0,<>0,>0,<0,>=0,<=0$, OV, OS, UO, BR.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | $x$ | $x$ | 1 |

## Example

| Statement List Program | Relay Logic |
| :---: | :---: |
| Power rail |  |
| X 11.0 | Contact I 1.0 |
| X $\quad 11.1$ | Contact I 1.1 |
| $=\quad \mathrm{Q} 4.0$ |  |

### 1.7 XN Exclusive Or Not

## Format

## XN <Bit>

| Address | Data type | Memory area |
| :--- | :--- | :--- |
| <Bit> | BOOL | I, Q, M, L, D, T, C |

## Description

XN checks whether the state of the addressed bit is " 0 ", and XORs the test result with the RLO.

## Status Word Bit Checks:

The EXCLUSIVE OR NOT instruction can also be used to directly check the status word by use of the following addresses: $==0,<>0,>0,<0,>=0,<=0$, OV, OS, UO, BR.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | $x$ | $x$ | 1 |

## Example

## $1.8 \quad 0 \quad$ And before Or

## Format

## 0

## Description

The $\mathbf{O}$ function performs a logical OR instruction on AND functions according to the rule: AND before OR.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | $x$ | 1 | - | $x$ |

## Example

### 1.9 A( And with Nesting Open

Format
A(

## Description

A( (AND nesting open) saves the RLO and OR bits and a function code into the nesting stack. A maximum of seven nesting stack entries are possible.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | 1 | - | 0 |

## Example

### 1.10 AN( And Not with Nesting Open

## Format

## AN(

## Description

AN( (AND NOT nesting open) saves the RLO and OR bits and a function code into the nesting stack. A maximum of seven nesting stack entries are possible.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | 1 | - | 0 |

### 1.11 O( Or with Nesting Open

## Format

O(

## Description

$\mathbf{O}($ (OR nesting open) saves the RLO and OR bits and a function code into the nesting stack. A maximum of seven nesting stack entries are possible.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | 1 | - | 0 |

### 1.12 ON( Or Not with Nesting Open

## Format

> ON(

## Description

ON( (OR NOT nesting open) saves the RLO and OR bits and a function code into the nesting stack. A maximum of seven nesting stack entries is possible.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | 1 | - | 0 |

### 1.13 X( Exclusive Or with Nesting Open

## Format

## X(

## Description

X( (XOR nesting open) saves the RLO and OR bits and a function code into the nesting stack. A maximum of seven nesting stack entries is possible.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | 1 | - | 0 |

### 1.14 XN( Exclusive Or Not with Nesting Open

## Format

## XN(

## Description

XN( (XOR NOT nesting open) saves the RLO and OR bits and a function code into the nesting stack. A maximum of seven nesting stack entries is possible.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | 1 | - | 0 |

### 1.15 ) Nesting Closed

## Format

## )

## Description

) (nesting closed) removes an entry from the nesting stack, restores the OR bit, interconnects the RLO that is contained in the stack entry with the current RLO according to the function code, and assigns the result to the RLO. The OR bit is also included if the function code is "AND" or "AND NOT".

Statements which open parentheses groups:

- U( And with Nesting Open
- UN( And Not with Nesting Open
- O( Or with Nesting Open
- ON( Or Not with Nesting Open
- X( Exclusive Or with Nesting Open
- XN( Exclusive Or Not with Nesting Open

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | $x$ | 1 | $x$ | 1 |

## Example

| Statement List Program |  | Relay Logic |  |
| :---: | :---: | :---: | :---: |
| Power rail |  |  |  |
| $\begin{aligned} & \text { A( } \\ & 0 \\ & 0 \\ & \text { 1 } \end{aligned}$ | $\begin{aligned} & \text { I } 0.0 \\ & \text { M } 10.0 \end{aligned}$ |  | M 10.0 |
| $\begin{aligned} & \text { A( } \\ & 0 \\ & 0 \\ & \text { ) } \end{aligned}$ | I 0.2 <br> M 10.3 | $10.2$ | M10.3 |
| A | M 10.1 | M 10.1 |  |
| $=$ | Q 4.0 | Q 4.0 Coil |  |

## $1.16=$ Assign

## Format

```
<Bit>
```

| Address | Data type | Memory area |
| :--- | :--- | :--- |
| <Bit> | BOOL | I, Q, M, L, D |

## Description

= <Bit> writes the RLO into the addressed bit for a switched on master control relay if $M C R=1$. If $M C R=0$, then the value 0 is written to the addressed bit instead of RLO.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | $x$ | - | 0 |

## Example

### 1.17 R Reset

## Format

```
R <Bit>
```

| Address | Data type | Memory area |
| :--- | :--- | :--- |
| <Bit> | BOOL | I, Q, M, L, D |

## Description

$\mathbf{R}$ (reset bit) places a " 0 " in the addressed bit if RLO = 1 and master control relay $M C R=1$. If $M C R=0$, then the addressed bit will not be changed.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | $x$ | - | 0 |

## Example

### 1.18 S Set

## Format

S <Bit>

| Address | Data type | Memory area |
| :--- | :--- | :--- |
| <Bit> | BOOL | I, Q, M, L, D |

## Description of instruction

S (set bit) places a "1" in the addressed bit if RLO = 1 and the switched on master control relay $\mathrm{MCR}=1$. If $\mathrm{MCR}=0$, the addressed bit does not change.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | $x$ | - | 0 |

## Example

| Statement List Program | Relay Logic |
| :---: | :---: |
|  |  |

### 1.19 NOT Negate RLO

## Format

## NOT

## Description

NOT negates the RLO.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | 1 | $x$ | - |

### 1.20 SET Set RLO (=1)

## Format

## SET

## Description

SET sets the RLO to signal state "1".

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | 1 | 1 | 0 |

## Example

| STL Program | Signal State | Result of Logic Operation (RLO) |
| :--- | :--- | :--- |
| SET | 1 |  |
| $=$ M 10.0 | 1 |  |
| $=$ M 15.1 | 1 |  |
| $=$ M 16.0 |  |  |
| CLR | 0 |  |
| $=$ M 10.1 | 0 |  |
| $=$ M 10.2 |  |  |

### 1.21 CLR Clear RLO (=0)

## Format

## CLR

## Description

CLR sets the RLO to signal state " 0 ".

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | 0 | 0 | 0 |

## Example

| Statement List | Signal State | Result of Logic Operation (RLO) |
| :--- | :--- | :--- |
| SET   <br> $=$ M 10.0 1  <br> $=$ M 15.1 1  <br> $=$ M 16.0 1  <br> CLR   <br> $=$ M 10.1 0  <br> $=$ M 10.2 0  |  |  |

### 1.22 SAVE Save RLO in BR Register

## Format

## SAVE

## Description of instruction

SAVE saves the RLO into the BR bit. The first check bit /FC is not reset. For this reason, the status of the $B R$ bit is included in the AND logic operation in the next network.

The use of SAVE and a subsequent query of the BR bit in the same block or in secondary blocks is not recommended because the BR bit can be changed by numerous instructions between the two. It makes sense to use the SAVE instruction before exiting a block because this sets the ENO output (= BR bit) to the value of the RLO bit and you can then add error handling of the block to this.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | x | - | - | - | - | - | - | - | - |

### 1.23 FN Edge Negative

## Format

## FN <Bit>

| Address | Data type | Memory area | Description |
| :--- | :--- | :--- | :--- |
| <Bit> | BOOL | I, Q, M, L, D | Edge flag, stores the previous <br> signal state of RLO. |

## Description

FN <Bit> (Negative RLO edge) detects a falling edge when the RLO transitions from "1" to "0", and indicates this by RLO = 1 .

During each program scan cycle, the signal state of the RLO bit is compared with that obtained in the previous cycle to see if there has been a state change. The previous RLO state must be stored in the edge flag address (<Bit>) to make the comparison. If there is a difference between current and previous RLO "1" state (detection of falling edge), the RLO bit will be "1" after this instruction.

## Note

The instruction has no point if the bit you want to monitor is in the process image because the local data for a block are only valid during the block's runtime.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | $x$ | $x$ | 1 |

## Definition

## Example

If the programmable logic controller detects a negative edge at contact I 1.0, it energizes the coil at Q 4.0 for one OB1 scan cycle.

| Statement List |  | Signal State Diagram |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| OB1 Scan Cycle No: |  |  | 1 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |  |

### 1.24 FP Edge Positive

## Format

```
FP <Bit>
```

| Address | Data type | Memory area | Description |
| :--- | :--- | :--- | :--- |
| <Bit> | BOOL | I, Q, M, L, D | Edge flag, stores the previous <br> signal state of RLO. |

## Description

FP <Bit> (Positive RLO edge) detects a rising edge when the RLO transitions from " 0 " to " 1 " and indicates this by RLO = 1 .

During each program scan cycle, the signal state of the RLO bit is compared with that obtained in the previous cycle to see if there has been a state change. The previous RLO state must be stored in the edge flag address (<Bit>) to make the comparison. If there is a difference between current and previous RLO "0" state (detection of rising edge), the RLO bit will be " 1 " after this instruction.

## Note

The instruction has no point if the bit you want to monitor is in the process image because the local data for a block are only valid during the block's runtime.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | $x$ | $x$ | 1 |

## Definition

## Example

If the programmable logic controller detects a positive edge at contact I 1.0, it energizes the coil at Q 4.0 for one OB1 scan cycle.

| Statement List | Signal State Diagram |  |  |  |  |  |  |  |  |  |

## 2 Comparison Instructions

### 2.1 Overview of Comparison Instructions

## Description

ACCU1 and ACCU2 are compared according to the type of comparison you choose:
== ACCU1 is equal to ACCU2
<> ACCU1 is not equal to ACCU2
$>$ ACCU1 is greater than ACCU2
< ACCU1 is less than ACCU2
>= ACCU1 is greater than or equal to ACCU2
<= ACCU1 is less than or equal to ACCU2
If the comparison is true, the RLO of the function is "1". The status word bits CC 1 and CC 0 indicate the relations "less," '"equal," or 'greater."

There are comparison instructions to perform the following functions:

- ? I Compare Integer (16-Bit)
- ? D Compare Double Integer (32-Bit)
- ? R Compare Floating-Point Number (32-Bit)

## 2.2 ? I Compare Integer (16-Bit)

## Format

$$
==I,<>|,>|,<l,>=I,<=l
$$

## Description of instruction

The Compare Integer (16-bit) instructions compare the contents of ACCU 2-L with the contents of ACCU 1-L .The contents of ACCU 2-L and ACCU 1-L are interpreted as 16 -bit integer numbers. The result of the comparison is indicated by the RLO and the setting of the relevant status word bits. RLO $=1$ indicates that the result of the comparison is true; $\mathrm{RLO}=0$ indicates that the result of the comparison is false. The status word bits CC 1 and CC 0 indicate the relations "less," "'equal," or "greater."

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | $x$ | $x$ | 0 | - | 0 | $x$ | $x$ | 1 |

## RLO values

| Comparison <br> instruction <br> executed | RLO Result if <br> ACCU 2 > ACCU 1 | RLO Result if <br> ACCU 2 = ACCU 1 | RLO Result if <br> ACCU 2 < ACCU 1 |
| :--- | :--- | :--- | :--- |
| $==1$ | 0 | 1 | 0 |
| $<>1$ | 1 | 0 | 1 |
| $>1$ | 1 | 0 | 0 |
| $<1$ | 0 | 0 | 1 |
| $>=1$ | 1 | 1 | 0 |
| $<=1$ | 0 | 1 | 1 |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | MW10 | //Load contents of MW10 (16-bit integer). |
| L | IW24 | //Load contents of IW24 (16-bit integer). |
| $>$ I |  | //Compare if ACCU 2-L (MW10) is greater ( $>$ ) than ACCU 1- L (IW24). |
| $=$ | M 2.0 | //RLO = 1 if MW10 $>$ IW24. |

## 2.3 ? D Compare Double Integer (32-Bit)

## Format

$$
==\mathrm{D},<>\mathrm{D},>\mathrm{D},<\mathrm{D},>=\mathrm{D},<=\mathrm{D}
$$

## Description of instruction

The Compare Double Integer (32-bit) instructions compare the contents of ACCU 2 with the contents of ACCU 1 . The contents of ACCU 2 and ACCU 1 are interpreted as 32-bit integer numbers. The result of the comparison is indicated by the RLO and the setting of the relevant status word bits. RLO = 1 indicates that the result of the comparison is true; $\mathrm{RLO}=0$ indicates that the result of the comparison is false. The status word bits CC 1 and CC 0 indicate the relations 'less," ''equal," or "'greater."

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | x | x | 0 | - | 0 | x | x | 1 |

## RLO values

| Comparison <br> instruction <br> executed | RLO Result if <br> ACCU 2 > ACCU 1 | RLO Result if <br> ACCU 2 = ACCU 1 | RLO Result if <br> ACCU 2 < ACCU 1 |
| :--- | :--- | :--- | :--- |
| ==D | 0 | 1 | 0 |
| <>D | 1 | 0 | 1 |
| >D | 1 | 0 | 0 |
| <D | 0 | 0 | 1 |
| >=D | 1 | 1 | 0 |
| <=D | 0 | 1 | 1 |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| L MD10 | //Load contents of MD10 (double integer, 32 bits). |  |
| L | ID24 | //Load contents of ID24 (double integer, 32 bits). |
| $>$ >D | //Compare if ACCU 2 (MD10) is greater (>) than ACCU 1 (ID24). |  |
| $=$ | M 2.0 | //RLO =1 if MD10 > ID24 |

## 2.4 ? R Compare Floating-Point Number (32-Bit)

## Format

$$
==\mathrm{R},<>\mathrm{R},>\mathrm{R},<\mathrm{R},>=\mathrm{R},<=\mathrm{R}
$$

## Description of instruction

The Compare Floating Point Number (32-bit, IEEE-FP) instructions compare the contents of ACCU 2 with the contents of ACCU 1. The contents of ACCU 1 and ACCU 2 are interpreted as floating-point numbers (32-bit, IEEE-FP). The result of the comparison is indicated by the RLO and the setting of the relevant status word bits. RLO = 1 indicates that the result of the comparison is true; RLO $=0$ indicates that the result of the comparison is false. The status word bits CC 1 and CC 0 indicate the relations ''less," ''equal," or ''greater."

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | $x$ | $x$ | $x$ | $x$ | 0 | $x$ | $x$ | 1 |

## RLO values

| Comparison <br> instruction <br> executed | RLO Result if <br> ACCU 2 > ACCU 1 | RLO Result if <br> ACCU 2 = ACCU 1 | RLO Result if <br> ACCU 2 < ACCU 1 |
| :--- | :--- | :--- | :--- |
| $==R$ | 0 | 1 | 0 |
| $<>R$ | 1 | 0 | 1 |
| $>R$ | 1 | 0 | 0 |
| $<R$ | 0 | 0 | 1 |
| $>=R$ | 1 | 1 | 0 |
| $<=R$ | 0 | 1 | 1 |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | MD10 | //Load contents of MD10 (floating-point number). |
| L | $1.359 \mathrm{E}+02$ | //Load the constant 1.359E+02. |
| $>\mathrm{R}$ |  | //Compare if ACCU 2 (MD10) is greater (>) than ACCU 1 (1.359-E+02) |

## 3 Conversion Instructions

### 3.1 Overview of Conversion Instructions

## Description

You can use the following instructions to convert binary coded decimal numbers and integers to other types of numbers:

- BTI BCD to Integer (16-Bit)
- ITB Integer (16-Bit) to BCD
- BTD BCD to Integer (32-Bit)
- ITD Integer (16-Bit) to Double Integer (32-Bit)
- DTB Double Integer (32-Bit) to BCD
- DTR Double Integer (32-Bit) to Floating-Point (32-Bit IEEE-FP)

You can use one of the following instructions to form the complement of an integer or to invert the sign of a floating-point number:

- INVI Ones Complement Integer (16-Bit)
- INVD Ones Complement Double Integer (32-Bit)
- NEGI Twos Complement Integer (16-Bit)
- NEGD Twos Complement Double Integer (32-Bit)
- NEGR Negate Floating-Point Number (32-Bit, IEEE-FP)

You can use the following Change Bit Sequence in Accumulator 1 instructions to reverse the order of bytes in the low word of accumulator 1 or in the entire accumulator:

- CAW Change Byte Sequence in ACCU 1-L (16-Bit)
- CAD Change Byte Sequence in ACCU 1 (32-Bit)

You can use any of the following instructions to convert a 32-bit IEEE floating-point number in accumulator 1 to a 32-bit integer (double integer). The individual instructions differ in their method of rounding:

- RND Round
- TRUNC Truncate
- RND+ Round to Upper Double Integer
- RND- Round to Lower Double Integer

## $3.2 \quad B T I \quad B C D$ to Integer (16-Bit)

## Format

## BTI

## Description

BTI (decimal to binary conversion of a 3-digit BCD number) interprets the contents of ACCU 1-L as a three-digit binary coded decimal number (BCD) and converts it to a 16 -bit integer. The result is stored in the low word of accumulator 1. The high word of accumulator 1 and accumulator 2 remain unchanged.
$B C D$ number in ACCU 1-L: The permissible value range for the BCD number is from "-999" to "+999". Bit 0 to bit 11 are interpreted as the value and bit 15 as the sign ( $0=$ positive, $1=$ negative ) of the BCD number. Bit 12 to bit 14 are not used in the conversion. If a decimal ( 4 bits) of the BCD number is in the invalid range of 10 to 15 , a BCDF error occurs during attempted conversion. In general, the CPU will go into STOP. However, you may design another error response by programming OB121 to handle this synchronous programming error.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

## $3.3 \quad$ ITB Integer (16-Bit) to BCD

## Format

ITB

## Description

ITB (binary to decimal conversion of a 16-bit integer number) interprets the contents of ACCU 1-L as a 16-bit integer and converts it to a three-digit binary coded decimal number (BCD). The result is stored in the low word of accumulator 1. Bit 0 to bit 11 contain the value of the $B C D$ number. Bit 12 to bit 15 are set to the state of the sign ( $0000=$ positive, $1111=$ negative) of the BCD number. The high word of accumulator 1 and accumulator 2 remain unchanged.

The BCD number can be in the range of "-999" to "+999." If the number is out of the permissible range, then the status bits OV and OS are set to 1 .

The instruction is executed without regard to, and without affecting, the RLO.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | $x$ | $x$ | - | - | - | - |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | MW10 | //Load the integer number into ACCU 1-L. |
| ITB |  | //Convert from integer to BCD (16-bit); store result in ACCU 1-L. |
| T | MW20 | //Transfer result (BCD number) to MW20. |

### 3.4 BTD BCD to Integer (32-Bit)

## Format

## BTD

## Description

BTD (decimal to binary conversion of a 7-digit BCD number) interprets the contents of ACCU 1 as a seven digit binary coded decimal number (BCD) and converts it to a 32 -bit double integer. The result is stored in accumulator 1. Accumulator 2 remains unchanged.

BCD number in ACCU 1: The permissible value range for the BCD number is from " $-9,999,999$ " to " $+9,999,999$ ". Bit 0 to bit 27 are interpreted as the value and bit 31 as the sign ( $0=$ positive, $1=$ negative ) of the BCD number. Bit 28 to bit 30 are not used in the conversion.

If any decimal digit (a 4-bit tetrad of the BCD coding) is in the invalid range of 10 to 15, a BCDF error occurs during attempted conversion. In general, the CPU will go into STOP. However, you may design another error response by programming OB121 to handle this synchronous programming error.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | MD10 | //Load the BCD number into ACCU 1. |
| BTD |  | //Convert from BCD to integer; store result in ACCU 1. |
| T | MD20 | //Transfer result (double integer number) to MD20. |

### 3.5 ITD Integer (16 Bit) to Double Integer (32-Bit)

## Format

ITD

## Description

ITD (conversion of a 16-bit integer number to a 32-bit integer number) interprets the contents of ACCU 1-L as a 16-bit integer and converts it to a 32-bit double integer. The result is stored in accumulator 1. Accumulator 2 remains unchanged.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

```
STL Explanation
L MW12 //Load the integer number into ACCU 1.
ITD //Convert from integer (16-bit) to double integer (32-bit); store result in
    ACCU 1.
T MD20 //Transfer result (double integer) to MD20.
```

## Example: MW12 = "-10" (Integer, 16-bit)

| Contents | ACCU1-H |  |  | ACCU1-L |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Bit | $31 \ldots$ | $\ldots$ | $\ldots$ | $\ldots 16$ | $15 \ldots$ | $\ldots$ | $\ldots$ | $\ldots 0$ |
| before execution of ITD | $X X X X$ | $X X X$ <br> $X$ | $X X X$ <br> $X$ | $X X X$ <br> $X$ | 1111 | 1111 | 1111 | 0110 |
| after execution of ITD | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 0110 |
|  |  |  |  |  |  |  |  |  |

### 3.6 DTB Double Integer (32-Bit) to BCD

## Format

```
DTB
```

## Description

DTB (binary to decimal conversion of a 32-bit integer number) interprets the content of ACCU 1 as a 32-bit double integer and converts it to a seven-digit binary coded decimal number (BCD). The result is stored in accumulator 1. Bit 0 to bit 27 contain the value of the BCD number. Bit 28 to bit 31 are set to the state of the sign of the $B C D$ number ( $0000=$ positive, $1111=$ negative). Accumulator 2 remains unchanged.

The BCD number can be in the range of "-9,999,999" to "+9,999,999". If the number is out of the permissible range, then the status bits OV and OS are set to 1.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | $x$ | $x$ | - | - | - | - |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | MD10 | //Load the 32 -bit integer into ACCU 1. |
| DTB |  | //Convert from integer (32-bit) to BCD, store result in ACCU 1. |
| T | MD20 | //Transfer result (BCD number) to MD20. |

### 3.7 DTR Double Integer (32-Bit) to Floating-Point (32-Bit IEEE-FP)

## Format

DTR

## Description

DTR (conversion of a 32-bit integer number to a 32-bit IEEE floating point number) interprets the content of ACCU 1 as a 32-bit double integer and converts it to a 32-bit IEEE floating point number. If necessary, the instruction rounds the result. (A 32-bit integer has a higher accuracy than a 32-bit floating point number). The result is stored in accumulator 1.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

```
STL Explanation
L MD10 //Load the 32-bit integer into ACCU 1.
DTR //Convert from double integer to floating point (32-bit IEEE FP); store result
    in ACCU 1.
T MD20 //Transfer result (BCD number) to MD20.
```

## $3.8 \quad$ INVI Ones Complement Integer (16-Bit)

## Format

INVI

## Description

INVI (ones complement integer) forms the ones complement of the 16-bit value in ACCU 1-L. Forming the ones complement inverts the value bit by bit, that is, zeros replace ones and ones replace zeros. The result is stored in the low word of accumulator 1.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | IW8 | //Load value into ACCU 1-L. |
| INVI |  | //Form ones complement 16-bit. |
| T | MW10 | //Transfer result to MW10. |

| Contents | ACCU1-L |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
| Bit | $15 \ldots$ | $\ldots$ | $\ldots$ | $\ldots 0$ |
| before execution of INVI | 0110 | 0011 | 1010 | 1110 |
| after execution of INVI | 1001 | 1100 | 0101 | 0001 |

### 3.9 INVD Ones Complement Double Integer (32-Bit)

## Format

INVD

## Description

INVD (ones complement double integer) forms the ones complement of the 32-bit value in ACCU 1. Forming the ones complement inverts the value bit by bit, that is, zeros replace ones, and ones replace zeros. The result is stored in accumulator 1.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | ID8 | //Load value into ACCU 1. |
| INVD |  | //Form ones complement (32-bit). |
| T | MD10 | //Transfer result to MD10. |

| Contents | ACCU1-H |  |  |  | ACCU1-L |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :---: |
| Bit | $31 \ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $15 \ldots$ | $\ldots$ | $\ldots$ | $\ldots$. |  |
| . | 0110 | 1111 | 1000 | 1100 | 0110 | 0011 | 1010 | 1110 |  |
| before execution of INVD | 010 | . | 0 |  |  |  |  |  |  |
| after execution of INVD | 1001 | 0000 | 0111 | 0011 | 1001 | 1100 | 0101 | 0001 |  |

### 3.10 NEGI Twos Complement Integer (16-Bit)

## Format

## NEGI

## Description

NEGI (twos complement integer) forms the twos complement of the 16-bit value in ACCU 1-L. Forming the twos complement inverts the value bit by bit, that is, zeros replace ones and ones replace zeros; then a " 1 " is added. The result is stored in the low word of accumulator 1 . The twos complement instruction is equivalent to multiplication by "-1." The status bits CC $1, \mathrm{CC} 0, \mathrm{OS}$, and OV are set as a function of the result of the operation.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | $x$ | $x$ | $x$ | $x$ | - | - | - | - |

| Status word generation | CC 1 | CC 0 | OV | OS |
| :--- | :--- | :--- | :--- | :--- |
| Result $=0$ | 0 | 0 | 0 | - |
| -32768 < Result <=-1 | 0 | 1 | 0 | - |
| $32767>=$ Result $>=1$ | 1 | 0 | 0 | - |
| Result $=2768$ | 0 | 1 | 1 | 1 |

## Example

| Contents | ACCU1-L |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
| Bit | $15 \ldots$ | $\ldots$ | $\ldots$ | $\ldots 0$ |
| before execution of NEGI | 0101 | 1101 | 0011 | 1000 |
| after execution of NEGI | 1010 | 0010 | 1100 | 1000 |

### 3.11 NEGD Twos Complement Double Integer (32-Bit)

## Format

NEGD

## Description

NEGD (twos complement double integer) forms the twos complement of the 32-bit value in ACCU 1. Forming the twos complement inverts the value bit by bit, that is, zeros replace ones and ones replace zeros; then a "1" is added. The result is stored in accumulator 1. The twos complement instruction is equivalent to a multiplication by " -1 " The instruction is executed without regard to, and without affecting, the RLO. The status bits CC 1, CC 0, OS, and OV are set as a function of the result of the operation.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | x | x | x | x | - | - | - | - |

| Status word generation | CC 1 | CC 0 | OV | OS |
| :--- | :--- | :--- | :--- | :--- |
| Result $=0$ | 0 | 0 | 0 | - |
| $-2.147 .483 .648<=$ Result $<=-1$ | 0 | 1 | 0 | - |
| $2.147 .483 .647>=$ Result $>=1$ | 1 | 0 | 0 | - |
| Result $=2147483648$ | 0 | 1 | 1 | 1 |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | ID8 | //Load value into ACCU 1. |
| NEGD |  | //Generate twos complement (32-bit). |
| T | MD10 | //Transfer result to MD10. |

| Contents | ACCU1-H |  |  |  | ACCU1-L |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Bit | $31 \ldots$ | $\ldots$ | $\ldots$ | $\ldots 16$ | $15 \ldots$ | $\ldots$ | $\ldots$ | $\ldots .0$ |
| before execution of <br> NEGD | 0101 | 1111 | 0110 | 0100 | 0101 | 1101 | 0011 | 1000 |
| after execution of NEGD | 1010 | 0000 | 1001 | 1011 | 1010 | 0010 | 1100 | 1000 |

### 3.12 NEGR Negate Floating-Point Number (32-Bit, IEEE-FP)

## Format

NEGR

## Description of instruction

NEGR (negate 32-bit IEEE floating-point number) negates the floating-point number (32-bit, IEEE-FP) in ACCU 1. The instruction inverts the state of bit 31 in ACCU 1 (sign of the mantissa). The result is stored in accumulator 1.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

```
|STL Explanation 
NEGR //Negate floating-point number (32-bit, IEEE-FP); stores the result in ACCU
    1.
T MD10 //Transfer result to MD10 (example: result = -1.5E+02).
```

### 3.13 CAW Change Byte Sequence in ACCU 1-L (16-Bit)

## Format

## CAW

## Description

CAW reverses the sequence of bytes in ACCU 1-L. The result is stored in the low word of accumulator 1 . The high word of accumulator 1 and accumulator 2 remain unchanged.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

| STL | Explanation |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| L | MW10 | //Load the value of MW10 into ACCU 1. |  |  |  |
| CAW |  |  |  |  |  |
| T | MW20 | //Reverse the sequence of bytes in ACCU 1-L. |  |  |  |
| //Transfer the result to MW20. |  |  |  |  |  |
|  | Contents ACCU1-H-H ACCU1-H-L ACCU1-L-H <br> ACCU1-L-L    <br> before execution of CAW value A value B value C <br>  value D   |  |  |  |  |

### 3.14 CAD Change Byte Sequence in ACCU 1 (32-Bit)

## Format

CAD

## Description

CAD reverses the sequence of bytes in ACCU 1. The result is stored in accumulator 1. Accumulator 2 remains unchanged.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

| STL |  | Explanation |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & \text { STL } \\ & \hline \text { L } \\ & \text { CAD } \\ & \hline \text { P } \end{aligned}$ | $\begin{aligned} & \hline \text { MD10 } \\ & \text { MD20 } \end{aligned}$ | //Load the value of MD10 into ACCU 1. <br> //Reverse the sequence of bytes in ACCU 1. <br> //Transfer the results to MD20. |  |  |  |  |
|  |  | Contents | ACCU1-H-H | ACCU1-H-L | ACCU1-L-H | ACCU1-L-L |
|  |  | before execution of CAD | value A | value $B$ | value C | value D |
|  |  | after execution of CAD | value D | value C | value $B$ | value A |

### 3.15 RND Round

## Format

RND

## Description

RND (conversion of a 32-bit IEEE floating-point number to 32-bit integer) interprets the contents of ACCU 1 as a 32-bit IEEE floating-point number (32-bit, IEEE-FP). The instruction converts the 32-bit IEEE floating-point number to a 32-bit integer (double integer) and rounds the result to the nearest whole number. If the fractional part of the converted number is midway between an even and an odd result, the instruction chooses the even result. If the number is out of the permissible range, then the status bits OV and OS are set to 1 . The result is stored in accumulator 1.

Conversion is not performed and an overflow indicated in the event of a fault (utilization of a NaN or a floating-point number that cannot be represented as a 32-bit integer number).

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | $x$ | $x$ | - | - | - | - |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | MD10 | //Load the floating-point number into ACCU 1-L. |
| RND |  | //Convert the floating-point number (32-bit, IEEE-FP) into an integer (32-bit) <br> and round off the result. |
| T | MD20 | //Transfer result (double integer number) to MD20. |

| Value before conversion |  | Value after conversion |
| :--- | :--- | :--- |
| MD10 $=$ "100.5" | A> RND => | MD20 $=$ "+100" |
| MD10 $=$ "-100.5" | => RND => | MD20 $="-100 "$ |

### 3.16 TRUNC Truncate

## Format

TRUNC

## Description

TRUNC (conversion of a 32-bit IEEE floating-point number to 32-bit integer) interprets the contents of ACCU 1 as a 32-bit IEEE floating-point number. The instruction converts the 32-bit IEEE floating-point number to a 32-bit integer (double integer). The result is the whole number part of the floating-point number to be converted (IEEE rounding mode "round to zero"). If the number is out of the permissible range, then the status bits OV and OS are set to 1 . The result is stored in accumulator 1.

Conversion is not performed and an overflow indicated in the event of a fault (utilization of a NaN or a floating-point number that cannot be represented as a 32-bit integer number).

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | $x$ | $x$ | - | - | - | - |

## Example

```
STL Explanation
L MD10 //Load the floating-point number into ACCU 1-L.
TRUN //Convert the floating-point number (32-bit, IEEE-FP) to an integer (32-bit)
C and round result. Store the result in ACCU 1.
T MD20 //Transfer result (double integer number) to MD20.
```

| Value before conversion |  | Value after conversion |
| :--- | :--- | :--- |
| MD10 $=$ "100.5" | $\Rightarrow>$ TRUNC => | MD20 $=$ "+100" |
| MD10 $=$ "-100.5" | $\Rightarrow>$ TRUNC => | MD20 $="-100 "$ |

### 3.17 RND+ Round to Upper Double Integer

## Format

RND+

## Description

RND+ (conversion of a 32-bit IEEE floating-point number to 32-bit integer) interprets the contents of ACCU 1 as a 32-bit IEEE floating-point number. The instruction converts the 32-bit IEEE floating-point number to a 32-bit integer (double integer) and rounds the result to the smallest whole number greater than or equal to the floating-point number that is converted (IEEE rounding mode "round to +infinity"). If the number is out of the permissible range, then the status bits OV and OS are set to 1.The result is stored in accumulator 1.

Conversion is not performed and an overflow is indicated in the event of a fault (utilization of a NaN or a floating-point number that cannot be represented as a 32-bit integer number.)

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | $x$ | $x$ | - | - | - | - |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | MD10 | //Load the floating-point number (32-bit, IEEE-FP) into ACCU 1-L. |
| RND+ | //Convert the floating-point number (32-bit, IEEE-FP) to an integer (32-bit) <br> and round result. Store output in ACCU 1. |  |
| T | MD20 | //Transfer result (double integer number) to MD20. |

| Value before conversion |  | Value after conversion |
| :--- | :--- | :--- |
| MD10 $=$ "100.5" | $\Rightarrow>~ R N D+~=>$ | $M D 20="+100 "$ |
| $M D 10="-100.5 "$ | $\Rightarrow>R N D+\Rightarrow>$ | $M D 20="-100 "$ |

### 3.18 RND- Round to Lower Double Integer

## Format

RND-

## Description

RND- (conversion of a 32-bit IEEE floating-point number to 32-bit integer) interprets the contents of ACCU 1 as 32-bit IEEE floating-point number. The instruction converts the 32-bit IEEE floating-point number to a 32-bit integer (double integer) and rounds the result to the largest whole number less than or equal to the floating-point number that is converted (IEEE rounding mode "round to -infinity"). If the number is out of the permissible range, then the status bits OV and OS are set to 1. The result is stored in accumulator 1.

Conversion is not performed and an overflow indicated in the event of a fault (utilization of a NaN or a floating-point number that cannot be represented as a 32-bit integer number.)

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | $x$ | $x$ | - | - | - | - |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | MD10 | //Load the floating-point number into ACCU 1-L. <br> //Convert the floating-point number ( $32-$ bit, IEEE-FP) to an integer (32-bit) |
| RND- | and round result. Store result in ACCU 1. |  |
| T | MD20 | //Transfer result (double integer number) to MD20. |

| Value before conversion |  | Value after conversion |
| :--- | :--- | :--- |
| MD10 $=$ "100.5" | A> RND- => | MD20 $="+100 "$ |
| MD10 $=$ "-100.5" | A> RND- => | MD20 $="-100 "$ |

## 4 Counter Instructions

### 4.1 Overview of Counter Instructions

## Description

A counter is a function element of the STEP 7 programming language that acounts. Counters have an area reserved for them in the memory of your CPU. This memory area reserves one 16 -bit word for each counter. The statement list instruction set supports 256 counters. To find out how many counters are available in your CPU, please refer to the CPU technical data.

Counter instructions are the only functions with access to the memory area.
You can vary the count value within this range by using the following Counter instructions:

- FR Enable Counter (Free)
- L Load Current Counter Value into ACCU 1
- LC Load Current Counter Value into ACCU 1 as BCD
- R Reset Counter
- S Set Counter Preset Value
- CU Counter Up
- CD Counter Down

### 4.2 FR Enable Counter (Free)

## Format

FR <counter>

| Address | Data type | Memory area | Description |
| :--- | :--- | :--- | :--- |
| <counter> | COUNTER | C | Counter, range <br> depends on CPU. |

## Description

When RLO transitions from "0" to "1", FR <counter> clears the edge-detecting flag that is used for setting and selecting upwards or downwards count of the addressed counter. Enable counter is not required to set a counter or for normal counting This means that in spite of a constant RLO of 1 for the Set Counter Preset Value, Counter Up, or Counter Down, these instructions are not executed again after the enable.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | - | - | 0 |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| A | I 2.0 | //Check signal state at input I 2.0. |
| FR | C3 | //Enable counter C3 when RLO transitions from 0 to 1. |

### 4.3 L Load Current Counter Value into ACCU 1

## Format

L <counter>

| Address | Data type | Memory area | Description |
| :--- | :--- | :--- | :--- |
| <counter> | COUNTER | C | Counter, range <br> depends on CPU. |

## Description

L <counter> loads the current count of the addressed counter as an integer into ACCU 1-L after the contents of ACCU 1 have been saved into ACCU 2.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | C3 | //Load ACCU 1-L with the count value of counter C3 in binary format. |

### 4.4 LC Load Current Counter Value into ACCU 1 as BCD

## Format

LC <counter>

| Address | Data type | Memory area | Description |
| :--- | :--- | :--- | :--- |
| <counter> | COUNTER | C | Counter, range <br> depends on CPU. |

## Description

LC <counter> loads the count of the addressed counter as a BCD number into ACCU 1 after the old contents of ACCU 1 have been saved into ACCU 2.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| LC | C3 | //Load ACCU 1-L with the count value of counter C3 in binary coded decimal <br> format. |

## $4.5 \quad$ R Reset Counter

## Format

$$
\mathrm{R} \text { <counter> }
$$

| Address | Data type | Memory area | Description |
| :--- | :--- | :--- | :--- |
| <Counter> | COUNTER | C | Counter to be preset, <br> range depends on <br> CPU. |

## Description

R <counter> loads the addressed counter with "0" if RLO=1.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | - | - | 0 |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| A | I 2.3 | //Check signal state at input I 2.3. |
| R | C3 | //Reset counter C3 to a value of 0 if RLO transitions from 0 to 1. |

### 4.6 S Set Counter Preset Value

## Format

S <counter>

| Address | Data type | Memory area | Description |
| :--- | :--- | :--- | :--- |
| <Counter> | COUNTER | C | Counter to be preset, <br> range depends on <br> CPU. |

## Description

$S$ <counter> loads the count from ACCU 1-L into the addressed counter when the RLO transitions from " 0 " to "1". The count in ACCU 1 must be a BCD number between "0" and "999".

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | - | - | 0 |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| A | I 2.3 | //Check signal state at input I 2.3. |
| L | C\#3 | //Load count value 3 into ACCU 1-L. |
| S | C1 | //Set counter C1 to count value if RLO transitions from 0 to 1. |

### 4.7 CU Counter Up

## Format

CU <counter>

| Address | Data type | Memory area | Description |
| :--- | :--- | :--- | :--- |
| <counter> | COUNTER | C | Counter, range <br> depends on CPU. |

## Description

CU <counter> increments the count of the addressed counter by 1 when RLO transitions from " 0 " to " 1 " and the count is less than " 999 ". When the count reaches its upper limit of " 999 ", incrementing stops. Additional transitions of RLO have no effect and overflow OV bit is not set.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | - | - | 0 |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| A | I 2.1 | //If there is a positive edge change at input I 2.1. |
| CU | C3 | //Counter C3 is incremented by 1 when RL0 transitions from 0 to 1. |

### 4.8 CD Counter Down

## Format

CD <counter>

| Address | Data type | Memory area | Description |
| :--- | :--- | :--- | :--- |
| <counter> | COUNTER | C | Counter, range <br> depends on CPU. |

## Description

CD <counter> decrements the count of the addressed counter by 1 when RLO transitions from " 0 " to " 1 " and the count is greater than 0 . When the count reaches its lower limit of " 0 ", decrementing stops. Additional transitions of RLO have no effect as the counter will not count with negative values.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | - | - | 0 |

## Example

| STL |  | Explanation |
| :---: | :---: | :---: |
| L | C\#14 | //Counter preset value. |
| A | I 0.1 | //Preset counter after detection of rising edge of 10.1. |
| S | C1 | //Load counter 1 preset if enabled. |
| A | I 0.0 | //One count down per rising edge of 10.0. |
| CD | C1 | //Decrement counter C1 by 1 when RL0 transitions from 0 to 1 depending on input I 0.0 . |
| AN | C1 | //Zero detection using the C1 bit. |
| $=$ | Q 0.0 | //Q 0.0 = 1 if counter 1 value is zero. |

## 5 Data Block Instructions

### 5.1 Overview of Data Block Instructions

## Description

You can use the Open a Data Block (OPN) instruction to open a data block as a shared data block or as an instance data block. The program itself can accomodate one open shared data block and one open instance data block at the same time.

The following Data Block instructions are available:

- OPN Open a Data Block
- CDB Exchange Shared DB and Instance DB
- L DBLG Load Length of Shared DB in ACCU 1
- L DBNO Load Number of Shared DB in ACCU 1
- L DILG Load Length of Instance DB in ACCU 1
- L DINO Load Number of Instance DB in ACCU 1

### 5.2 OPN Open a Data Block

## Format

## OPN <data block>

| Address | Data block type | Source address |
| :--- | :--- | :--- |
| <data block> | DB, DI | 1 to 65535 |

## Description of instruction

OPN <data block> opens a data block as a shared data block or as an instance data block. One shared data block and one instance data block can be open at the same time.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

| STL |  | Explanation |
| :--- | :--- | :--- |
| OPN | DB10 | //Open data block DB10 as a shared data block. |
| L | DBW35 | //Load data word 35 of the opened data block into ACCU 1-L. |
| T | MW22 | //Transfer the content of ACCU 1-L into MW22. |
| OPN | DI20 | //Open data block DB20 as an instance data block. |
| L | DIB12 | //Load data byte 12 of the opened instance data block into ACCU 1-L. |
| T | DBB37 | //Transfer the content of ACCU 1-L to data byte 37 of the opened shared data <br> block. |

### 5.3 CDB Exchange Shared DB and Instance DB

## Format

## CDB

## Description of instruction

CDB is used to exchange the shared data block and instance data block. The instruction swaps the data block registers. A shared data block becomes an instance data block and vice-versa.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

### 5.4 L DBLG Load Length of Shared DB in ACCU 1

Format
L DBLG

## Description of instruction

L DBLG (load length of shared data block) loads the length of the shared data block into ACCU 1 after the contents of ACCU 1 have been saved into ACCU 2.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| OPN | DB10 | //Open data block DB10 as shared data block. |
| L | DBLG | //Load length of shared data block (length of DB10). |
| L | MD10 | //Value for comparison if data block is long enough. |
| <D |  |  |
| JC | ERRO | //Jump to ERRO jump label if length is less than value in MD10. |

### 5.5 L DBNO Load Number of Shared DB in ACCU 1

## Format

L DBNO

## Description of instruction

L DBNO (load number of shared data block) loads the number of the shared open data block into ACCU 1-L after the content of ACCU 1 has been saved into ACCU 2.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## 5.6 <br> L DILG Load Length of Instance DB in ACCU 1

Format
L DILG

## Description of instruction

L DILG (load length of instance data block) loads the length of the instance data block into ACCU 1-L after the content of ACCU 1 has been saved into ACCU 2.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| OPN | D120 | //Open data block DB20 as an instance data block. |
| L | DILG | //Load length of instance data block (length of DB20). |
| L | MW10 | //Value for comparison if data block is long enough. |
| <1 |  | //Jump to ERRO jump label if length is less than value in MW10. |

### 5.7 L DINO Load Number of Instance DB in ACCU 1

## Format

L DINO

## Description of instruction

L DINO (load number of instance data block) loads the number of the opened instance data block into ACCU 1 after the content of ACCU 1 has been saved into ACCU 2.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## $6 \quad$ Logic Control Instructions

### 6.1 Overview of Logic Control Instructions

## Description

You can use the Jump instructions to control the flow of logic, enabling your program to interrupt its linear flow to resume scanning at a different point. You can use the LOOP instruction to call a program segment multiple times.

The address of a Jump or Loop instruction is a label. A jump label may be as many as four characters, and the first character must be a letter. Jumps labels are followed with a mandatory colon ":" and must precede the program statement in a line.

## Note

Please note for S7-300 CPU programs that the jump destination always (not for 318-2) forms the beginning of a Boolean logic string in the case of jump instructions. The jump destination must not be included in the logic string.

You can use the following jump instructions to interrupt the normal flow of your program unconditionally:

- JU Jump Unconditional
- JL Jump to Labels

The following jump instructions interrupt the flow of logic in your program based on the result of logic operation (RLO) produced by the previous instruction statement:

- JC Jump if RLO = 1
- JCN Jump if RLO = 0
- JCB Jump if RLO = 1 with BR
- JNB Jump if RLO $=0$ with BR

The following jump instructions interrupt the flow of logic in your program based on the signal state of a bit in the status word:

- JBI Jump if $\mathrm{BR}=1$
- JNBI Jump if $B R=0$
- JO Jump if OV = 1
- JOS Jump if OS = 1

The following jump instructions interrupt the flow of logic in your program based on the result of a calculation:

- JZ Jump if Zero
- JN Jump if Not Zero
- JP Jump if Plus
- JM Jump if Minus
- JPZ Jump if Plus or Zero
- JMZ Jump if Minus or Zero
- JUO Jump if Unordered

### 6.2 JU Jump Unconditional

## Format

## JU <jump label>

| Address | Description |
| :--- | :--- |
| <jump label > | Symbolic name of jump destination. |

## Description

JU <jump label> interrupts the linear program scan and jumps to a jump destination, regardless of the status word contents. The linear program scan resumes at the jump destination. The jump destination is specified by a jump label. Both forward and backward jumps are possible. Jumps may be executed only within a block, that is, the jump instruction and the jump destination must lie within one and the same block. The jump destination must be unique within this block. The maximum jump distance is -32768 or +32767 words of program code. The actual maximum number of statements you can jump over depends on the mix of the statements used in your program (one-, two-, or three word statements).

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

| STL | Explanation |  |  |  |
| :--- | :--- | :--- | :--- | :---: |
|  | A | I 1.0 |  |  |
|  | A | I 1.2 |  |  |
|  | JC | DELE | //Jump if RLO=1 to jump label DELE. |  |
|  | L | MB10 |  |  |
|  | INC | 1 |  |  |
|  | T | MB10 |  |  |
| JELE: | L | FORW | //Jump unconditionally to jump label FORW. |  |
|  | T | MB10 |  |  |
| FORW: | A | I 2.1 | //Program scan resumes here after jump to jump label FORW. |  |

### 6.3 JL Jump to Labels

## Format

## JL <jump label>

| Address | Description |
| :--- | :--- |
| <jump label > | Symbolic name of jump destination. |

## Description

JL <jump label> (jump via jump to list) enables multiple jumps to be programmed. The jump target list, with a maximum of 255 entries, begins on the next line after the JL instruction and ends on the line before the jump label referenced in the JL address. Each jump destination consists of one JU instruction. The number of jump destinations ( 0 to 255) is taken from ACCU 1-L-L.
The $\mathbf{J L}$ instruction jumps to one of the $\mathbf{J U}$ instructions as long as the contents of the ACCU is smaller than the number of jump destinations between the JL instruction and the jump label. The first JU instruction is jumped to if ACCU 1-L-L=0. The second $\mathbf{J U}$ instruction is jumped to if ACCU 1-L-L=1, etc. The JL instruction jumps to the first instruction after the last $\mathbf{J U}$ instruction in the destination list if the number of jump destinations is too large.
The jump destination list must consist of JU instructions which precede the jump label referenced in the address of the JL instruction. Any other instruction within the jump list is illegal.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

| STL |  |  | Explanation |
| :---: | :---: | :---: | :---: |
|  | L | MB0 | //Load jump destination number into ACCU 1-L-L. |
|  | JL | LSTX | //Jump destination if ACCU 1-L-L > 3. |
|  | JU | SEG0 | //Jump destination if ACCU 1-L-L $=0$. |
|  | JU | SEG1 | //Jump destination if ACCU 1-L-L $=1$. |
|  | JU | COMM | //Jump destination if ACCU 1-L-L $=2$. |
|  | JU | SEG3 | //Jump destination if ACCU 1-L-L $=3$. |
| LSTX: | JU | COMM |  |
| SEG0: | * |  | //Permitted instruction |
| SEG1: | ${ }_{*}^{\text {JU }}$ | COMM | //Permitted instruction |
| SEG3: | * ${ }^{\text {U }}$ | COMM | //Permitted instruction. |
| COMM : | * ${ }^{\text {J }}$ | COMM |  |
|  | * |  |  |

### 6.4 JC Jump if RLO = 1

## Format

## JC <jump label>

| Address | Description |
| :--- | :--- |
| <jump label > | Symbolic name of jump destination. |

## Description

If the result of logic operation is $1, \mathrm{JC}$ <jump label> interrupts the linear program scan and jumps to a jump destination. The linear program scan resumes at the jump destination. The jump destination is specified a jump label. Both forward and backward jumps are possible. Jumps may be executed only within a block, that is, the jump instruction and the jump destination must lie within one and the same block. The jump destination must be unique within this block. The maximum jump distance is -32768 or +32767 words of program code. The actual maximum number of statements you can jump over depends on the mix of the statements used in your program (one-, two-, or three word statements).
If the result of logic operation is 0 , the jump is not executed. The RLO is set to 1 , and the program scan continues with the next statement.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | 1 | 1 | 0 |

## Example

| STL | Explanation |  |  |
| :--- | :--- | :--- | :--- |
|  | A | I 1.0 |  |
|  | A | I 1.2 |  |
|  | JC | JOVR | //Jump if RLO=1 to jump label JOVR. |
|  | L | IW8 | //Program scan continues here if jump is not executed. |
| JOVR: | A | MW22 2.1 | //Program scan resumes here after jump to jump label JoVR. |

### 6.5 JCN Jump if RLO = 0

## Format

## JCN <jump label>

| Address | Description |
| :--- | :--- |
| <jump label > | Symbolic name of jump destination. |

## Description

If the result of logic operation is $0, \mathrm{JCN}$ <jump label> interrupts the linear program scan and jumps to a jump destination. The linear program scan resumes at the jump destination. The jump destination is specified by a jump label. Both forward and backward jumps are possible. Jumps may be executed only within a block, that is, the jump instruction and the jump destination must lie within one and the same block. The jump destination must be unique within this block. The maximum jump distance is -32768 or +32767 words of program code. The actual maximum number of statements you can jump over depends on the mix of the statements used in your program (one-, two-, or three word statements).
If the result of logic operation is 1 , the jump is not executed. The program scan continues with the next statement.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | 1 | 1 | 0 |

## Example

| STL | Explanation |  |  |
| :--- | :--- | :--- | :--- |
|  | A | I 1.0 |  |
|  | A | I 1.2 |  |
|  | JCN | JOVR | //Jump if RLO $=0$ to jump label JOVR. |
|  | L | IW8 | //Program scan continues here if jump is not executed. |
|  | T | MW22 |  |
| JOVR: | A | I 2.1 | //Program scan resumes here after jump to jump label JoVR. |

### 6.6 JCB Jump if RLO = 1 with BR

## Format

## JCB <jump label>

| Address | Description |
| :--- | :--- |
| <jump label > | Symbolic name of jump destination. |

## Description

If the result of logic operation is $1, \mathrm{JCB}$ <jump label> interrupts the linear program scan and jumps to a jump destination. The linear program scan resumes at the jump destination. The jump destination is specified by a jump label. Both forward and backward jumps are possible. Jumps may be executed only within a block, that is, the jump instruction and the jump destination must lie within one and the same block. The jump destination must be unique within this block. The maximum jump distance is -32768 or +32767 words of program code. The actual maximum number of statements you can jump over depends on the mix of the statements used in your program (one-, two-, or three word statements).
If the result of logic operation is 0 , the jump is not executed. The RLO is set to 1 , and the program scan continues with the next statement.

Independent of the RLO, the RLO is copied into the BR for the JCB <jump label> instruction.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | X | - | - | - | - | 0 | 1 | 1 | 0 |

## Example

| STL Explanation |  |  |  |
| :---: | :---: | :---: | :---: |
|  | A | I 1.0 |  |
|  | A | I 1.2 |  |
|  | JCB | JOVR | //Jump if RLO = 1 to jump label JOVR. Copy the contents of the RLO bit into the BR bit. |
|  | L | IW8 | //Program scan continues here if jump is not executed. |
|  | T | MW22 |  |
| JOVR: | A | I 2.1 | //Program scan resumes here after jump to jump label JOVR. |

### 6.7 JNB Jump if RLO = 0 with BR

## Format

## JNB <jump label>

| Address | Description |
| :--- | :--- |
| <jump label > | Symbolic name of jump destination. |

## Description

If the result of logic operation is 0 , JNB <jump label> interrupts the linear program scan and jumps to a jump destination. The linear program scan resumes at the jump destination. The jump destination is specified by a jump label. Both forward and backward jumps are possible. Jumps may be executed only within a block, that is, the jump instruction and the jump destination must lie within one and the same block. The jump destination must be unique within this block. The maximum jump distance is -32768 or +32767 words of program code. The actual maximum number of statements you can jump over depends on the mix of the statements used in your program (one-, two-, or three word statements).
If the result of logic operation is 1 , the jump is not executed. The RLO is set to 1 and the program scan continues with the next statement.

Independent of the RLO, the RLO is copied into the BR when there is a JNB <jump label> instruction.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | X | - | - | - | - | 0 | 1 | 1 | 0 |

## Example

### 6.8 JBI Jump if $\mathrm{BR}=1$

## Format

## JBI <jump label>

| Address | Description |
| :--- | :--- |
| <jump label > | Symbolic name of jump destination. |

## Description

If status bit BR is $1, \mathbf{J B I}$ <jump label> interrupts the linear program scan and jumps to a jump destination. The linear program scan resumes at the jump destination. The jump destination is specified by a jump label. A jump label may be as many as four characters, and the first character must be a letter. Jump labels are followed with a mandatory colon ":" and must precede the program statement in a line. Both forward and backward jumps are possible. Jumps may be executed only within a block, that is, the jump instruction and the jump destination must lie within one and the same block. The jump destination must be unique within this block. The maximum jump distance is -32768 or +32767 words of program code. The actual maximum number of statements you can jump over depends on the mix of the statements used in your program (one-, two-, or three word statements).

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | 1 | - | 0 |

### 6.9 JNBI Jump if $B R=0$

## Format

## JNBI <jump label>

| Address | Description |
| :--- | :--- |
| <jump label > | Symbolic name of jump destination. |

## Description

If status bit BR is $0, \mathbf{J N B I}$ <jump label> interrupts the linear program scan and jumps to a jump destination. The linear program scan resumes at the jump destination. The jump destination is specified by a jump label. Both forward and backward jumps are possible. Jumps may be executed only within a block, that is, the jump instruction and the jump destination must lie within one and the same block. The jump destination must be unique within this block. The maximum jump distance is -32768 or +32767 words of program code. The actual maximum number of statements you can jump over depends on the mix of the statements used in your program (one-, two-, or three word statements).

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | 1 | - | 0 |

### 6.10 JO Jump if OV = 1

## Format

## JO <jump label>

| Address | Description |
| :--- | :--- |
| <jump label > | Symbolic name of jump destination. |

## Description

If status bit OV is $1, \mathbf{J O}$ <jump label> interrupts the linear program scan and jumps to a jump destination. The linear program scan resumes at the jump destination. The jump destination is specified by a jump label. Both forward and backward jumps are possible. Jumps may be executed only within a block, that is, the jump instruction and the jump destination must lie within one and the same block. The jump destination must be unique within this block. The maximum jump distance is -32768 or +32767 words of program code. The actual maximum number of statements you can jump over depends on the mix of the statements used in your program (one-, two-, or three word statements). In a combined math instruction, check for overflow after each separate math instruction to ensure that each intermediate result is within the permissible range, or use instruction JOS.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

| STL |  |  | Explanation |
| :---: | :---: | :---: | :---: |
|  | L | MW10 |  |
|  | L | 3 |  |
|  | *I |  | //Multiply contents of MW10 by "3". |
|  | J0 | OVER | //Jump if result exceeds maximum range ( $0 V=1$ ). |
|  | T | MW10 | //Program scan continues here if jump is not executed. |
|  | A | M 4.0 |  |
|  | R | M 4.0 |  |
|  | JU | NEXT |  |
| OVER: | AN | M 4.0 | //Program scan resumes here after jump to jump label OVER. |
|  | S | M 4.0 |  |
| NEXT : | NOP 0 |  | //Program scan resumes here after jump to jump label NEXT. |

### 6.11 JOS Jump if OS = 1

## Format

## JOS <jump label>

| Address | Description |
| :--- | :--- |
| <jump label > | Symbolic name of jump destination. |

## Description

If status bit OS is $1, \mathrm{JOS}$ <jump label> interrupts the linear program scan and jumps to a jump destination. The linear program scan resumes at the jump destination. The jump destination is specified by a jump label. Both forward and backward jumps are possible. Jumps may be executed only within a block, that is, the jump instruction and the jump destination must lie within one and the same block. The jump destination must be unique within this block. The maximum jump distance is -32768 or +32767 words of program code. The actual maximum number of statements you can jump over depends on the mix of the statements used in your program (one-, two-, or three word statements).

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | 0 | - | - | - | - |

## Example

| STL |  |  | Explanation |
| :---: | :---: | :---: | :---: |
|  | L | IW10 |  |
|  | L | MW12 |  |
|  | *I |  |  |
|  | L | DBW25 |  |
|  | +I |  |  |
|  | L | MW14 |  |
|  | -I |  |  |
|  | J0S | OVER | //Jump if overflow in one of the three instructions during calculation $0 S=1$. (See Note). |
|  | T | MW16 | //Program scan continues here if jump is not executed. |
|  | A | M 4.0 |  |
|  | R | M 4.0 |  |
|  | JU | NEXT |  |
| OVER: | AN | M 4.0 | //Program scan resumes here after jump to jump label OVER. |
|  | S | M 4.0 |  |
| NEXT : | NOP 0 |  | //Program scan resumes here after jump to jump label NEXT. |

## Note

In this case do not use the JO instruction. The JO instruction would only check the previous -I instruction if an overflow occurred.

### 6.12 JZ Jump if Zero

## Format

## JZ <jump label>

| Address | Description |
| :--- | :--- |
| <jump label > | Symbolic name of jump destination. |

## Description

If status bits CC $1=0$ and CC $0=0, \mathrm{JZ}$ <jump label> (jump if result $=0$ ) interrupts the linear program scan and jumps to a jump destination. The linear program scan resumes at the jump destination. The jump destination is specified by a jump label. Both forward and backward jumps are possible. Jumps may be executed only within a block, that is, the jump instruction and the jump destination must lie within one and the same block. The jump destination must be unique within this block. The maximum jump distance is -32768 or +32767 words of program code. The actual maximum number of statements you can jump over depends on the mix of the statements used in your program (one-, two-, or three word statements).

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

### 6.13 JN Jump if Not Zero

## Format

## JN <jump label>

| Address | Description |
| :--- | :--- |
| <jump label > | Symbolic name of jump destination. |

## Description

If the result indicated by the status bits CC 1 and CC 0 is greater or less than zero (CC 1=0/CC 0=1 or CC 1=1/CC 0=0), JN <jump label> (jump if result <> 0) interrupts the linear program scan and jumps to a jump destination. The linear program scan resumes at the jump destination. The jump destination is specified by a jump label. Both forward and backward jumps are possible. Jumps may be executed only within a block, that is, the jump instruction and the jump destination must lie within one and the same block. The jump destination must be unique within this block. The maximum jump distance is -32768 or +32767 words of program code. The actual maximum number of statements you can jump over depends on the mix of the statements used in your program (one-, two-, or three word statements).

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

| STL |  | Explanation |  |
| :--- | :--- | :--- | :--- |
|  | L | IW8 |  |
|  | L | MW12 |  |
|  | XOW |  |  |
|  | JN | NOZE | //Jump if the contents of ACCU 1-L are not equal to zero. |
|  | AN | M 4.0 | //Program scan continues here if jump is not executed. |
|  | S | M 4.0 |  |
| NOZE: $:$ | AN | MEXT |  |
|  | S 4.1 | //Program scan resumes here after jump to jump label NOZE. |  |
| NEXT: | NOP 0 | M 4.1 |  |
|  |  |  | //Program scan resumes here after jump to jump label NEXT. |

### 6.14 JP Jump if Plus

## Format

## JP <jump label>

| Address | Description |
| :--- | :--- |
| <jump label > | Symbolic name of jump destination. |

## Description

If status bits CC $1=1$ and CC $0=0$, JP <jump label> (jump if result <0) interrupts the linear program scan and jumps to a jump destination. The linear program scan resumes at the jump destination. The jump destination is specified by a jump label. Both forward and backward jumps are possible. Jumps may be executed only within a block, that is, the jump instruction and the jump destination must lie within one and the same block. The jump destination must be unique within this block. The maximum jump distance is -32768 or +32767 words of program code. The actual maximum number of statements you can jump over depends on the mix of the statements used in your program (one-, two-, or three word statements).

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

| STL |  |  | Explanation |
| :---: | :---: | :---: | :---: |
|  | L | IW8 |  |
|  | L | MW12 |  |
|  | -I |  | //Subtract contents of MW12 from contents of IW8. |
|  | JP | POS | //Jump if result >0 (that is, ACCU $1>0$ ). |
|  | AN | M 4.0 | //Program scan continues here if jump is not executed. |
|  | S | M 4.0 |  |
|  | JU | NEXT |  |
| POS : | AN | M 4.1 | //Program scan resumes here after jump to jump label POS. |
|  | S | M 4.1 |  |
| NEXT : | NOP 0 |  | //Program scan resumes here after jump to jump label NEXT. |

### 6.15 JM Jump if Minus

## Format

## JM <jump label>

| Address | Description |
| :--- | :--- |
| <jump label > | Symbolic name of jump destination. |

## Description

If status bits CC $1=0$ and CC $0=1$, JM <jump label> (jump if result <0) interrupts the linear program scan and jumps to a jump destination. The linear program scan resumes at the jump destination. The jump destination is specified by a jump label. Both forward and backward jumps are possible. Jumps may be executed only within a block, that is, the jump instruction and the jump destination must lie within one and the same block. The jump destination must be unique within this block. The maximum jump distance is -32768 or +32767 words of program code. The actual maximum number of statements you can jump over depends on the mix of the statements used in your program (one-, two-, or three word statements).

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

### 6.16 JPZ Jump if Plus or Zero

## Format

## JPZ <jump label>

| Address | Description |
| :--- | :--- |
| <jump label > | Symbolic name of jump destination. |

## Description

If the result indicated by the status bits CC 1 and CC 0 is greater than or equal to zero (CC $1=0 / C C 0=0$ or CC $1=1 / C C 0=0$ ), JPZ <jump label> (jump if result >=0) interrupts the linear program scan and jumps to a jump destination. The linear program scan resumes at the jump destination. The jump destination is specified by a jump label. Both forward and backward jumps are possible. Jumps may be executed only within a block, that is, the jump instruction and the jump destination must lie within one and the same block. The jump destination must be unique within this block. The maximum jump distance is -32768 or +32767 words of program code. The actual maximum number of statements you can jump over depends on the mix of the statements used in your program (one-, two-, or three word statements).

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - |  |

## Example

| STL | Explanation |  |  |
| :--- | :--- | :--- | :--- |
|  | L | IW8 |  |
|  | L | MW12 |  |
|  | I |  | //Subtract contents of MW12 from contents of IW8. |
|  | JPZ | REG0 | //Jump if result >=0 (that is, contents of ACCU 1 >= 0 ). . |
|  | AN | M 4.0 | //Program scan continues here if jump is not executed. |
|  | S | M 4.0 |  |
| JU | NEXT |  |  |
| REG0: | AN | M 4.1 | //Program scan resumes here after jump to jump label REG0. |
|  | S | M 4.1 |  |
| NEXT: | NOP 0 |  | //Program scan resumes here after jump to jump label NEXT. |

### 6.17 JMZ Jump if Minus or Zero

## Format

## JMZ <jump label>

| Address | Description |
| :--- | :--- |
| <jump label > | Symbolic name of jump destination. |

## Description

If the result indicated by the status bits CC 1 and CC 0 is less than or equal to zero (CC 1=0/CC $0=0$ or CC 1=0/CC $0=1$ ), JMZ <jump label> (jump if result <= 0 ) interrupts the linear program scan and jumps to a jump destination. The linear program scan resumes at the jump destination. The jump destination is specified by a jump label. Both forward and backward jumps are possible. Jumps may be executed only within a block, that is, the jump instruction and the jump destination must lie within one and the same block. The jump destination must be unique within this block. The maximum jump distance is -32768 or +32767 words of program code. The actual maximum number of statements you can jump over depends on the mix of the statements used in your program (one-, two-, or three word statements).

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

| STL |  |  | Explanation |
| :---: | :---: | :---: | :---: |
|  | L | IW8 |  |
|  | L | MW12 |  |
|  | -I |  | //Subtract contents of MW12 from contents of IW8. |
|  | JMZ | RGE0 | //Jump if result <=0 (that is, contents of ACCU $1<=0$ ). |
|  | AN | M 4.0 | //Program scan continues here if jump is not executed. |
|  | S | M 4.0 |  |
|  | JU | NEXT |  |
| RGE0 : | AN | M 4.1 | //Program scan resumes here after jump to jump label RGE0. |
|  | S | M 4.1 |  |
| NEXT: | NOP 0 |  | //Program scan resumes here after jump to jump label NEXT. |

### 6.18 JUO Jump if Unordered

## Format

## JUO <jump label>

| Address | Description |
| :--- | :--- |
| <jump label > | Symbolic name of jump destination. |

## Description

If status bits CC $1=1$ and CC $0=1$, JUO <jump label> interrupts the linear program scan and jumps to a jump destination. The linear program scan resumes at the jump destination. The jump destination is specified by a jump label. Both forward and backward jumps are possible. Jumps may be executed only within a block, that is, the jump instruction and the jump destination must lie within one and the same block. The jump destination must be unique within this block. The maximum jump distance is -32768 or +32767 words of program code. The actual maximum number of statements you can jump over depends on the mix of the statements used in your program (one-, two-, or three word statements).
Status bits CC $1=1$ and CC $0=1$ when

- A division by zero occurred
- An illegal instruction was used
- The result of a floating-point comparison is "unordered," that is, when a invalid format was used.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

| STL |  |  | Explanation |
| :---: | :---: | :---: | :---: |
|  | L | MD10 |  |
|  | L | ID2 |  |
|  | /D |  | //Divide contents of MD10 by contents of ID2. |
|  | JU0 | ERRO | //Jump if division by zero (that is, ID2 = 0). |
|  | T | MD14 | //Program scan continues here if jump is not executed. |
|  | A | M 4.0 |  |
|  | R | M 4.0 |  |
|  | JU | NEXT |  |
| ERRO: | AN | M 4.0 | //Program scan resumes here after jump to jump label ERRO. |
|  | S | M 4.0 |  |
| NEXT: | NOP 0 |  | //Program scan resumes here after jump to jump label NEXT. |

### 6.19 LOOP Loop

## Format

## LOOP <jump label>

| Address | Description |
| :--- | :--- |
| <jump label > | Symbolic name of jump destination. |

## Description

LOOP <jump label> (decrement ACCU 1-L and jump if ACCU 1-L <> 0) simplifies loop programming. The loop counter is accommodated in ACCU 1-L. The instruction jumps to the specified jump destination. The jump is executed as long as the content of $\mathrm{ACCO} 1-\mathrm{L}$ is not equal to 0 . The linear program scan resumes at the jump destination. The jump destination is specified by a jump label. Both forward and backward jumps are possible. Jumps may be executed only within a block, that is, the jump instruction and the jump destination must lie within one and the same block. The jump destination must be unique within this block. The maximum jump distance is -32768 or +32767 words of program code. The actual maximum number of statements you can jump over depends on the mix of the statements used in your program (one-, two-, or three word statements).

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example for calculating the factor of 5

| STL |  |  | Explanation |
| :---: | :---: | :---: | :---: |
| NEXT: | L | L\#1 |  |
|  | T | MD20 | //Transfer the contents from ACCU 1 into MD20 (initialization). |
|  | L | 5 | //Load number of loop cycles into ACCU 1-L. |
|  | T | MW10 | //Jump label = loop start / transfer ACCU 1-L to loop counter. |
|  | L | MD20 |  |
|  | * | D | //Multiply current contents of MD20 by the current contents of MB10. |
|  | T | MD20 | //Transfer the multiplication result to MD20. |
|  | L | MW10 | //Load contents of loop counter into ACCU 1. |
|  | LOOP | next | //Decrement the contents of ACCU 1 and jump to the NEXT jump label if ACCU 1-L > 0 . |
|  | L | MW24 | //Program scan resumes here after loop is finished. |
|  | L | 200 |  |
|  | >I |  |  |

## $7 \quad$ Integer Math Instructions

### 7.1 Overview of Integer Math Instructions

## Description

The math operations combine the contents of accumulators 1 and 2 . In the case of CPUs with two accumulators, the contents of accumulator 2 remains unchanged.

In the case of CPUs with four accumulators, the contents of accumulator 3 is then copied into accumulator 2 and the contents of accumulator 4 into accumulator 3 . The old contents of accumulator 4 remains unchanged.
Using integer math, you can carry out the following operations with two integer numbers (16 and 32 bits):

- +I Add ACCU 1 and ACCU 2 as Integer (16-Bit)
- -I Subtract ACCU 1 from ACCU 2 as Integer (16-Bit)
- *I Multiply ACCU 1 and ACCU 2 as Integer (16-Bit)
- II Divide ACCU 2 by ACCU 1 as Integer (16-Bit)
-     + Add Integer Constant (16, 32 Bit)
- +D Add ACCU 1 and ACCU 2 as Double Integer (32-Bit)
- -D Subtract ACCU 1 from ACCU 2 as Double Integer (32-Bit)
- *D Multiply ACCU 1 and ACCU 2 as Double Integer (32-Bit)
- ID Divide ACCU 2 by ACCU 1 as Double Integer (32-Bit)
- MOD Division Remainder Double Integer (32-Bit)

### 7.2 Evaluating the Bits of the Status Word with Integer Math Instructions

## Description

The integer math instructions influence the following bits in the Status word: CC1 and CCO, OV and OS.

The following tables show the signal state of the bits in the status word for the results of instructions with Integers (16 and 32 bits):

| Valid Range for the Result | CC 1 | CC 0 | OV | OS |
| :--- | :--- | :--- | :--- | :--- |
| 0 (zero) | 0 | 0 | 0 | $*$ |
| 16 bits: $-32768<=$ result <br> $<0$ (negative number) <br> 32 bits: $-2147483648 ~<=$ result < 0 (negative number) | 0 | 1 | 0 | $*$ |
| 16 bits: $32767>=$ result $>0$ (positive number) <br> 32 bits: $2147483647>=$ result $>0$ (positive number) | 1 | 0 | 0 | $*$ |

* The OS bit is not affected by the result of the instruction.

| Invalid Range for the Result | A1 | AO | OV | OS |
| :--- | :--- | :--- | :--- | :--- |
| Underflow (addition) <br> 16 bits: result $=-65536$ <br> 32 bits: result $=-4294967296$ | 0 | 0 | 1 | 1 |
| Underflow (multiplication) <br> 16 bits: result < -32 768 (negative number) <br> 32 bits: result <-2 147483648 (negative number) | 0 | 1 | 1 | 1 |
| Overflow (addition, subtraction) <br> 16 bits: result $>32767$ (positive number) <br> 32 bits: result > 2147483647 (positive number) | 0 | 1 | 1 | 1 |
| Overflow (multiplication, division) <br> 16 bits: result $>32767$ (positive number) <br> 32 bits: result $>2147483647$ (positive number) | 1 | 0 | 1 | 1 |
| Underflow (addition, subtraction) <br> 16 bits: result $<-32.768$ (negative number) <br> 32 bits: result $<-2147483648$ (negative number) | 1 | 0 | 1 | 1 |
| Division by 0 | 1 | 1 | 1 | 1 |

| Operation | A1 | A0 | OV | OS |
| :--- | :--- | :--- | :--- | :--- |
| +D: result $=-4294967296$ | 0 | 0 | 1 | 1 |
| ID or MOD: division by 0 | 1 | 1 | 1 | 1 |

## $7.3 \quad+\quad$ Add ACCU 1 and ACCU 2 as Integer (16-Bit)

## Format

$+$

## Description

+I (add 16-bit integer numbers) adds the contents of ACCU 1-L to the contents of ACCU 2-L and stores the result in ACCU 1-L. The contents of ACCU 1-L and ACCU $2-L$ are interpreted as 16 -bit integer numbers. The instruction is executed without regard to, and without affecting, the RLO. The status word bits CC 1, CC $0, O S$, and OV are set as a function of the result of the instruction. The instruction produces a 16-bit integer number instead of an 32-bit integer number in the event of an overflow/underflow.

The contents of accumulator 2 remain unchanged for CPUs with two ACCUs.
The contents of accumulator 3 are copied into accumulator 2, and the contents of accumulator 4 are copied into accumulator 3 for CPUs with four ACCUs. The contents of accumulator 4 remain unchanged.

See also Evaluating the Bits of the Status Word with Integer Math Instructions.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | $x$ | $x$ | $x$ | $x$ | - | - | - | - |

| Status bit generation | CC 1 | CC 0 | OV | OS |
| :--- | :--- | :--- | :--- | :--- |
| Sum $=0$ | 0 | 0 | 0 | - |
| $-32768<=$ Sum < 0 | 0 | 1 | 0 | - |
| $32767>=$ Sum >0 | 1 | 0 | 0 | - |
| Sum $=-65536$ | 0 | 0 | 1 | 1 |
| $65534>=$ Sum $>32767$ | 0 | 1 | 1 | 1 |
| $-65535<=$ Sum <-32768 | 1 | 0 | 1 | 1 |

## Example

| STL |  | Explanation |
| :--- | :--- | :--- |
| L | IW10 | //Load the value of IW10 into ACCU 1-L. |
| L | MW14 | //Load the contents of ACCU 1-L into ACCU 2-L. Load the value of MW14 into |
| +I |  |  |
| T | ACCU 1-L. |  |
|  | //Add ACCU 2-L and ACCU 1-L; store the result in ACCU 1-L. |  |

## $7.4 \quad$-I Subtract ACCU 1 from ACCU 2 as Integer (16-Bit)

## Format

## -

## Description

-I (subtract 16-bit integer numbers) subtracts the contents of ACCU 1-L from the contents of ACCU 2-L and stores the result in ACCU 1-L. The contents of ACCU 1-L and ACCU $2-$ L are interpreted as 16 -bit integer numbers. The instruction is executed without regard to, and without affecting, the RLO. The status word bits CC 1, CC 0 , OS, and OV are set as a function of the result of the instruction. The instruction produces a 16-bit integer number instead of an 32-bit integer number in the event of an overflow/underflow.

The contents of accumulator 2 remain unchanged for CPUs with two ACCUs.
The contents of accumulator 3 are copied into accumulator 2, and the contents of accumulator 4 are copied into accumulator 3 for CPUs with four ACCUs. The contents of accumulator 4 remain unchanged.

See also Evaluating the Bits of the Status Word with Integer Math Instructions.

## Status word

|  | //The contents of ACCU 1-L (result) are transferred to DBW25 of DB1. |  |

## 7.5 * Multiply ACCU 1 and ACCU 2 as Integer (16-Bit)

## Format

* 

## Description

*I (multiply 16-bit integer numbers) multiplies the contents of ACCU 2-L by the contents of ACCU 1-L. The contents of ACCU 1-L and ACCU 2-L are interpreted as 16 -bit integer numbers. The result is stored in accumulator 1 as a 32-bit integer number. If the status word bits are OV1 = 1 and $\mathrm{OS}=1$, the result is outside the range of a 16-bit integer number.

The instruction is executed without regard to, and without affecting, the RLO. The status word bits CC $1, \mathrm{CC} 0, \mathrm{OS}$, and OV are set as a function of the result of the instruction.

The contents of accumulator 2 remain unchanged for CPUs with two ACCUs.
The contents of accumulator 3 are copied into accumulator 2, and the contents of accumulator 4 are copied into accumulator 3 for CPUs with four ACCUs.

### 7.6 II Divide ACCU 2 by ACCU 1 as Integer (16-Bit)

## Format

## II

## Description

II (divide 16-bit integer numbers) divides the contents of ACCU 2-L by the contents of ACCU 1-L. The contents of ACCU 1-L and ACCU 2-L are interpreted as 16-bit integer numbers. The result is stored in accumulator 1 and consists of two 16-bit integer numbers, the quotient, and the remainder. The quotient is stored in ACCU $1-\mathrm{L}$ and the remainder in ACCU 1-H. The instruction is executed without regard to, and without affecting, the RLO. The status word bits CC $1, \mathrm{CC} 0, \mathrm{OS}$, and OV are set as a function of the result of the instruction.

The contents of accumulator 2 remain unchanged for CPUs with two ACCUs.
The contents of accumulator 3 are copied into accumulator 2, and the contents of accumulator 4 are copied into accumulator 3 for CPUs with four ACCUs. The contents of accumulator 4 remain unchanged.

| + |  |  |
| T | MD28 |  |

## $7.8 \quad$ +D Add ACCU 1 and ACCU 2 as Double Integer (32-Bit)

## Format

+D

## Description

+D (add 32-bit integer numbers) adds the contents of ACCU 1 to the contents of ACCU 2 and stores the result in ACCU 1. The contents of ACCU 1 and ACCU 2 are interpreted as 32 -bit integer numbers. The instruction is executed without regard to, and without affecting, the RLO. The status word bits CC 1, CC $0, O S$, and OV are set as a function of the result of the instruction.

The contents of accumulator 2 remain unchanged for CPUs with two ACCUs.
The contents of accumulator 3 are copied into accumulator 2, and the contents of accumulator 4 are copied into accumulator 3 for CPUs with four ACCUs. The contents of accumulator 4 remain unchanged.

### 7.11 ID Divide ACCU 2 by ACCU 1 as Double Integer (32-Bit)

## Format

## ID

## Description

ID (divide 32-bit integer numbers) divides the contents of ACCU 2 by the contents of ACCU 1. The contents of ACCU 1 and ACCU 2 are interpreted as 32-bit integer numbers. The result of the instruction is stored in accumulator 1. The result gives only the quotient and not the remainder. (The instruction MOD can be used to get the remainder.)

The instruction is executed without regard to, and without affecting, the RLO. The status word bits CC $1, \mathrm{CC} 0, \mathrm{OS}$, and OV are set as a function of the result of the instruction.

The contents of accumulator 2 remain unchanged for CPUs with two ACCUs.
The contents of accumulator 3 are copied into accumulator 2, and the contents of accumulator 4 are copied into accumulator 3 for CPUs with four ACCUs. The contents of accumulator 4 remain unchanged.

"13/4"
"3"

### 7.12 MOD Division Remainder Double Integer (32-Bit)

## Format

## MOD

## Description

MOD (remainder of the division of 32-bit integer numbers) divides the contents of ACCU 2 by the contents of ACCU 1. The contents of ACCU 1 and ACCU 2 are interpreted as 32-bit integer numbers. The result of the instruction is stored in accumulator 1. The result gives only the division remainder, and not the quotient. (The instruction /D can be used to get the quotient.)

The instruction is executed without regard to, and without affecting, the RLO. The status word bits CC 1, CC 0, OS, and OV are set as a function of the result of the instruction.

The contents of accumulator 2 remain unchanged for CPUs with two ACCUs.
The contents of accumulator 3 are copied into accumulator 2, and the contents of accumulator 4 are copied into accumulator 3 for CPUs with four ACCUs. The contents of accumulator 4 remain unchanged.

$$

## 8 Floating-Point Math Instructions

### 8.1 Overview of Floating-Point Math Instructions

## Description

The math instructions combine the contents of accumulators 1 and 2 . In the case of CPUs with two accumulators, the contents of accumulator 2 remains unchanged.

In the case of CPUs with four accumulators, the contents of accumulator 3 is copied into accumulator 2 and the contents of accumulator 4 into accumulator 3 . The old contents of accumulator 4 remains unchanged.
The IEEE 32-bit floating-point numbers belong to the data type called REAL. You can use the floating-point math instructions to perform the following math instructions using two 32-bit IEEE floating-point numbers:

- +R Add ACCU 1 and ACCU
- -R Subtract ACCU 1 from ACCU 2
- *R Multiply ACCU 1 and ACCU 2
- /R Divide ACCU 2 by ACCU 1

Using floating-point math, you can carry out the following operations with one 32-bit IEEE floating-point number:

- ABS Absolute Value
- SQR Generate the Square
- SQRT Generate the Square Root
- EXP Generate the Exponential Value
- LN Generate the Natural Logarithm
- SIN Generate the Sine of Angles
- COS Generate the Cosine of Angles
- TAN Generate the Tangent of Angles
- ASIN Generate the Arc Sine
- ACOS Generate the Arc Cosine
- ATAN Generate the Arc Tangent

### 8.2 Evaluating the Bits of the Status Word with Floating-Point Math Instructions

## Description

The basic arithmetic types influence the following bits in the Status word: CC 1 and CC 0, OV and OS.

The following tables show the signal state of the bits in the status word for the results of instructions with floating-point numbers ( 32 bits):

| Valid Area for a Result | CC 1 | CC 0 | OV | OS |
| :--- | :--- | :--- | :--- | :--- |
| $+0,-0$ (Null) | 0 | 0 | 0 | $*$ |
| $-3.402823 \mathrm{E}+38$ < result < -1.175494E-38 (negative number) | 0 | 1 | 0 | $*$ |
| $+1.175494 \mathrm{E}-38$ < result < 3.402824E +38 (positive number) | 1 | 0 | 0 | $*$ |

* The OS bit is not affected by the result of the instruction.

| Invalid Area for a Result | CC 1 | CC 0 | OV | OS |
| :--- | :--- | :--- | :--- | :--- |
| Underflow <br> $-1.175494 \mathrm{E}-38 ~<~ r e s u l t ~<-1.401298 E-45 ~(n e g a t i v e ~ n u m b e r) ~$ | 0 | 0 | 1 | 1 |
| Underflow <br> $+1.401298 \mathrm{E}-45 ~<~ r e s u l t ~<~+1.175494 E-38 ~(p o s i t i v e ~ n u m b e r) ~$ | 0 | 0 | 1 | 1 |
| Overflow <br> Result < $-3.402823 \mathrm{E}+38$ (negative number) | 0 | 1 | 1 | 1 |
| Overflow <br> Result > 3.402823E+38 (positive number) | 1 | 0 | 1 | 1 |
| Not a valid floating-point number or illegal instruction <br> (input value outside the valid range) | 1 | 1 | 1 | 1 |

### 8.3 Floating-Point Math Instructions: Basic

### 8.3.1 $\quad+\mathrm{R} \quad$ Add ACCU 1 and ACCU 2 as a Floating-Point Number (32-Bit IEEE-FP)

## Format

+ $\mathbf{R}$

## Description of instruction

+ $\mathbf{R}$ (add 32-bit IEEE floating-point numbers) adds the contents of accumulator 1 to the contents of accumulator 2 and stores the result in accumulator 1 . The contents of accumulator 1 and accumulator 2 are interpreted as 32-bit IEEE floating-point numbers. The instruction is executed without regard to, and without affecting, the RLO. The status bits CC 1, CC 0, OS, and OV are set as a function of the result of the instruction.

The contents of accumulator 2 remain unchanged for CPUs with two ACCUs.
The contents of accumulator 3 are copied into accumulator 2, and the contents of accumulator 4 are copied into accumulator 3 for CPUs with four ACCUs. The contents of accumulator 4 remain unchanged.

## Result

| The result in ACCU 1 is | CC 1 | CC 0 | OV | OS | Note |
| :--- | :--- | :--- | :--- | :--- | :--- |
| +qNaN | 1 | 1 | 1 | 1 |  |
| +infinite | 1 | 0 | 1 | 1 | Overflow |
| +normalized | 1 | 0 | 0 | - |  |
| +denormalized | 0 | 0 | 1 | 1 | Underflow |
| +zero | 0 | 0 | 0 | - |  |
| -zero | 0 | 0 | 0 | - |  |
| -denormalized | 0 | 0 | 1 | 1 | Underflow |
| -normalized | 0 | 1 | 0 | - |  |
| -infinite | 0 | 1 | 1 | 1 | Overflow |
| -qNaN | 1 | 1 | 1 | 1 |  |

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | $x$ | $x$ | $x$ | $x$ | - | - | - | - |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| OPN | DB10 | //Load the value of ID10 into ACCU 1. |
| L | ID10 | //Load the value of ACCU 1 into ACCU 2. Load the value of MD14 into ACCU 1. |
| L | MD14 | //Add ACCU 2 and ACCU 1; store the result in ACCU 1. |
| +R | DBD25 | //The content of ACCU 1 (result) is transferred to DBD25 in DB10. |

### 8.3.2 $\quad$-R Subtract ACCU 1 from ACCU 2 as a Floating-Point Number (32-Bit IEEE-FP)

## Format

## -R

## Description

-R (subtract 32-bit IEEE floating-point numbers) subtracts the contents of accumulator 1 from the contents of accumulator 2 and stores the result in accumulator 1 . The contents of accumulator 1 and accumulator 2 are interpreted as 32-bit IEEE floating-point numbers. The result is stored in accumulator 1. The instruction is executed without regard to, and without affecting, the RLO. The status bits CC 1, CC 0, OS, and OV are set as a function of the result of the instruction.

The contents of accumulator 2 remain unchanged for CPUs with two ACCUs.
The contents of accumulator 3 are copied into accumulator 2, and the contents of accumulator 4 are copied into accumulator 3 for CPUs with four ACCUs. The contents of accumulator 4 remain unchanged.

## Result

| The result in ACCU 1 is | CC 1 | CC 0 | OV | OS | Note |
| :--- | :--- | :--- | :--- | :--- | :--- |
| +qNaN | 1 | 1 | 1 | 1 |  |

### 8.3.3 *R Multiply ACCU 1 and ACCU 2 as Floating-Point Numbers (32-Bit IEEE-FP)

## Format

## *R

## Description of instruction

*R (multiply 32-bit IEEE floating-point numbers) multiplies the contents of accumulator 2 by the contents of accumulator 1 . The contents of accumulator 1 and accumulator 2 are interpreted as 32-bit IEEE floating-point numbers. The result is stored in accumulator 1 as a 32-bit IEEE floating-point number. The instruction is executed without regard to, and without affecting, the RLO. The status bits CC 1, CC 0 , OS, and OV are set as a result of the instruction.

The contents of accumulator 2 remain unchanged for CPUs with two ACCUs.
The contents of accumulator 3 are copied into accumulator 2, and the contents of accumulator 4 are copied into accumulator 3 for CPUs with four ACCUs. The contents of accumulator 4 remain unchanged.

## Result

| *R | //Multiply ACCU 2 and ACCU 1; store the result in ACCU 1. |  |
| T | DBD25 | //The content of ACCU 1 (result) is transferred to DBD25 in DB10. |

### 8.3.4 $\quad$ IR Divide ACCU 2 by ACCU 1 as a Floating-Point Number (32-Bit IEEE-FP)

## Format

IR

## Description of instruction

IR (divide 32-bit IEEE floating-point numbers) divides the contents of accumulator 2 by the contents of accumulator 1 . The contents of accumulator 1 and accumulator 2 are interpreted as 32-bit IEEE floating-point numbers. The instruction is executed without regard to, and without affecting, the RLO. The status bits CC 1, CC 0, OS, and OV are set as a function of the result of the instruction.

The contents of accumulator 2 remain unchanged for CPUs with two ACCUs.
The contents of accumulator 3 are copied into accumulator 2, and the contents of accumulator 4 are copied into accumulator 3 for CPUs with four ACCUs.

## Result

| The result in ACCU 1 is | CC 1 | CC 0 | OV | OS | Note |

| L | MD14 | //Load the contents of ACCU 1 into ACCU 2. Load the value of MD14 into ACCU |
|  |  | 1. |
| /R |  | //Divide ACCU 2 by ACCU 1 ; store the result in ACCU 1. |
| T | DBD20 | //The content of ACCU 1 (result) is transferred to DBD20 in DB10. |

### 8.3.5 ABS Absolute Value of a Floating-Point Number (32-Bit IEEE-FP)

## Format

## ABS

## Description

ABS (absolute value of a 32-bit IEEE FP) produces the absolute value of a floating-point number (32-bit IEEE floating-point number) in ACCU 1. The result is stored in accumulator 1. The instruction is executed without regard to, and without affecting, the status bits.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | ID8 | //Load value into ACCU 1 (example: ID8 $=-1.5 E+02$ ). |
| ABS |  | //Form the absolute value; store the result in ACCU 1. |
| T | MD10 | //Transfer result to MD10 (example: result =1.5E+02). |

### 8.4 Floating-Point Math Instructions: Extended

### 8.4.1 SQR Generate the Square of a Floating-Point Number (32-Bit)

## Format

SQR

## Description of instruction

SQR (generate the square of an IEEE-FP 32-bit floating-point number) calculates the square of a floating-point number (32-bit, IEEE-FP) in ACCU 1. The result is stored in accumulator 1. The instruction influences the CC 1, CC $0, O V$, and OS status word bits.

The contents of accumulator 2 (and also the contents of accumulator 3 and accumulator 4 for CPUs with four ACCUs) remain unchanged.

## Result

| The result in ACCU 1 is | CC 1 | CC 0 | OV | OS | Note |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $+q N a N$ | 1 | 1 | 1 | 1 |  |
| + infinite | 1 | 0 | 1 | 1 | Overflow |
| +normalized | 1 | 0 | 0 | - |  |
| + denormalized | 0 | 0 | 1 | 1 | Underflow |
| $+z e r o$ | 0 | 0 | 0 | - |  |
| $-q N a N$ | 1 | 1 | 1 | 1 |  |

## Example

| STL |  |  | Explanation |
| :---: | :---: | :---: | :---: |
|  | OPN | DB17 | //Open data block DB17. |
|  | L | DBD0 | //The value from data double word DBDO is loaded into ACCU 1. (This value must be in the floating-point format.) |
|  | SQR |  | //Calculate the square of the floating-point number (32-bit, IEEE-FP) in ACCU 1. Store the result in ACCU 1. |
|  | AN | OV | //Scan the ov bit in the status word for "0." |
|  | JC | OK | //If no error occurred during the SQR instruction, jump to the OK jump label. |
| BEU |  |  | //Block end unconditional, if an error occurred during the SQR instruction. |
| OK: | T | DBD4 | //Transfer the result from ACCU 1 to data double word DBD4 |

### 8.4.2 SQRT Generate the Square Root of a Floating-Point Number (32-Bit)

## Format

## SQRT

## Description of instruction

SQRT (generate the square root of a 32-bit, IEEE-FP floating-point number) calculates the square root of a floating-point number (32-bit, IEEE-FP) in ACCU 1. The result is stored in accumulator 1. The input value must be greater than or equal to zero. The result is then positive. Only exception the square root of -0 is -0 . The instruction influences the CC 1, CC 0, OV, and OS status word bits.

The contents of accumulator 2 (and also the contents of accumulator 3 and accumulator 4 for CPUs with four ACCUs) remain unchanged.

## Result

| The result in ACCU 1 is | CC 1 | CC 0 | OV | OS | Note |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $+q N a N$ | 1 | 1 | 1 | 1 |  |
| +infinite | 1 | 0 | 1 | 1 | Overflow |
| +normalized | 1 | 0 | 0 | - |  |
| +denormalized | 0 | 0 | 1 | 1 | Underflow |
| +zero | 0 | 0 | 0 | - |  |
| -zero | 0 | 0 | 0 | - |  |
| -qNaN | 1 | 1 | 1 | 1 |  |

## Example

| STL |  | Explanation |
| :--- | :--- | :--- |
|  | L MD10 | //The value from memory double word MD10 is loaded into ACCU 1. (This <br> value must be in the floating -point format.) <br> //Calculate the square root of the floating-point number (32-bit, |
|  | SQRT | IEEE-FP) in ACCU 1. Store the result in ACCU 1. |

### 8.4.3 EXP Generate the Exponential Value of a Floating-Point Number (32-Bit)

## Format

## EXP

## Description of instruction

EXP (generate the exponential value of a floating-point number, 32-bit, IEEE-FP) calculates the exponential value (exponential value for base e) of a floating-point number (32-bit, IEEE-FP) in ACCU 1. The result is stored in accumulator 1. The instruction influences the CC 1, CC $0, \mathrm{OV}$, and OS status word bits.

The contents of accumulator 2 (and also the contents of accumulator 3 and accumulator 4 for CPUs with four ACCUs) remain unchanged.

## Result

| The result in ACCU 1 is | CC 1 | CC 0 | OV | OS | Note |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $+q N a N$ | 1 | 1 | 1 | 1 |  |
| +infinite | 1 | 0 | 1 | 1 | Overflow |
| +normalized | 1 | 0 | 0 | - |  |
| +denormalized | 0 | 0 | 1 | 1 | Underflow |
| +zero | 0 | 0 | 0 | - |  |
| $-q N a N$ | 1 | 1 | 1 | 1 |  |

## Example

| STL |  |  | ```Explanation //The value from memory double word MD10 is loaded into ACCU 1. (This value must be in the floating-point format.)``` |
| :---: | :---: | :---: | :---: |
|  | L | MD10 |  |
|  | EXP |  | //Calculate the exponential value of the floating-point number (32-bit, IEEE-FP) in ACCU 1 at base e. Store the result in ACCU 1. |
|  | AN | OV | //Scan the OV bit in the status word for "0." |
|  | JC | OK | //If no error occurred during the EXP instruction, jump to the OK jump label. |
| BEU |  |  | //Block end unconditional, if an error occurred during the EXP instruction. |
| OK: | T | MD20 | //Transfer the result from ACCU 1 to memory double word MD20. |

### 8.4.4 LN Generate the Natural Logarithm of a Floating-Point Number (32-Bit)

## Format

## LN

## Description of instruction

LN (generate the natural logarithm of an IEEE-FP 32-bit floating-point number) calculates the natural logarithm (logarithm to base e) of a floating-point number (32-bit, IEEE-FP) in ACCU 1. The result is stored in accumulator 1. The input value must be greater than zero. The instruction influences the CC 1, CC 0, UO, and OV status word bits.

The contents of accumulator 2 (and also the contents of accumulator 3 and accumulator 4 for CPUs with four ACCUs) remain unchanged.

## Result

| The result in ACCU 1 is | CC 1 | CC 0 | OV | OS | Note |
| :--- | :--- | :--- | :--- | :--- | :--- |
| + qNaN | 1 | 1 | 1 | 1 |  |
| +infinite | 1 | 0 | 1 | 1 | Overflow |
| +normalized | 1 | 0 | 0 | - |  |
| +denormalized | 0 | 0 | 1 | 1 | Underflow |
| +zero | 0 | 0 | 0 | - |  |
| -zero | 0 | 0 | 0 | - |  |
| -denormalized | 0 | 0 | 1 | 1 | Underflow |
| -normalized | 0 | 1 | 0 | - |  |
| -infinite | 0 | 1 | 1 | 1 | Overflow |
| -qNaN | 1 | 1 | 1 | 1 |  |

## Example

| STL |  |  | Explanation <br> //The value from memory double word MD10 is loaded into ACCU 1. (This |
| :---: | :---: | :---: | :---: |
|  | L | MD10 |  |
|  | LN |  | //Calculate the natural logarithm of the floating-point number (32-bit, IEEE-FP) in ACCU 1. Store the result in ACCU 1. |
|  | AN | OV | //Scan the OV bit in the status word for "0." |
|  | JC | OK | //If no error occurred during the instruction, jump to the ok jump label. |
| BEU |  |  | //Block end unconditional, if an error occurred during the instruction. |
| OK: | T | nD | //Transfer the result from ACCU 1 to memory double word MD20. |

### 8.4.5 SIN Generate the Sine of Angles as Floating-Point Numbers (32-Bit)

## Format

## SIN

## Description of instruction

SIN (generate the sine of angles as floating-point numbers, 32-bit, IEEE-FP) calculates the sine of an angle specified as a radian measure. The angle must be present as a floating-point number in ACCU 1. The result is stored in accumulator 1. The instruction influences the CC $1, \mathrm{CC} 0, \mathrm{OV}$, and OS status word bits.

The contents of accumulator 2 (and the contents of accumulator 3 and accumulator 4 for CPUs with four ACCUs) remain unchanged.

## Result

| The result in ACCU 1 is | CC 1 | CC 0 | OV | OS | Note |
| :--- | :--- | :--- | :--- | :--- | :--- |
| + qNaN | 1 | 1 | 1 | 1 |  |
| +normalized | 1 | 0 | 0 | - |  |
| +denormalized | 0 | 0 | 1 | 1 | Overflow |
| +zero | 0 | 0 | 0 | - |  |
| -zero | 0 | 0 | 0 | - |  |
| -denormalized | 0 | 0 | 1 | 1 | Underflow |
| -normalized | 0 | 1 | 0 | - |  |
| -qNaN | 1 | 1 | 1 | 1 |  |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | MD10 | //The value from memory double word MD10 is loaded into ACCU 1. (This value <br> must be in the floating-point format.) |
| SIN |  | //Calculate the sine of the floating-point number (32-bit, IEEE-FP) in ACCU |
| T | MD20 Store the result in ACCU 1. |  |

### 8.4.6 COS Generate the Cosine of Angles as Floating-Point Numbers (32-Bit)

## Format

## cos

## Description of instruction

COS (generate the cosine of angles as floating-point numbers, 32-bit, IEEE-FP) calculates the cosine of an angle specified as a radian measure. The angle must be present as a floating-point number in ACCU 1. The result is stored in accumulator 1. The instruction influences the CC $1, \mathrm{CC} 0, \mathrm{OV}$, and OS status word bits.

The contents of accumulator 2 (and the contents of accumulator 3 and accumulator 4 for CPUs with four ACCUs) remain unchanged.

## Result

| The result in ACCU 1 is | CC 1 | CC 0 | OV | OS | Note |
| :--- | :--- | :--- | :--- | :--- | :--- |
| + qNaN | 1 | 1 | 1 | 1 |  |
| +normalized | 1 | 0 | 0 | - |  |
| +denormalized | 0 | 0 | 1 | 1 | Overflow |
| +zero | 0 | 0 | 0 | - |  |
| -zero | 0 | 0 | 0 | - |  |
| -denormalized | 0 | 0 | 1 | 1 | Underflow |
| -normalized | 0 | 1 | 0 | - |  |
| -qNaN | 1 | 1 | 1 | 1 |  |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | MD10 | //The value from memory double word MD10 is loaded into ACCU 1. (This value <br> must be in the floating-point format.) |
| Cos |  | //Calculate the cosine of the floating-point number (32-bit, IEEE-FP) in ACCU |
| T | MD20 Store the result in ACCU 1. |  |

### 8.4.7 TAN Generate the Tangent of Angles as Floating-Point Numbers (32-Bit)

## Format

## TAN

## Description of instruction

TAN (generate the tangent of angles as floating-point numbers, 32-bit, IEEE-FP) calculates the tangent of an angle specified as a radian measure. The angle must be present as a floating-point number in ACCU 1. The result is stored in accumulator 1. The instruction influences the CC $1, \mathrm{CC} 0, \mathrm{OV}$, and OS status word bits.

The contents of accumulator 2 (and the contents of accumulator 3 and accumulator 4 for CPUs with four ACCUs) remain unchanged.

## Result

| The result in ACCU 1 is | CC 1 | CC 0 | OV | OS | Note |
| :--- | :--- | :--- | :--- | :--- | :--- |
| + qNaN | 1 | 1 | 1 | 1 |  |
| +infinite | 1 | 0 | 1 | 1 | Overflow |
| +normalized | 1 | 0 | 0 | - |  |
| +denormalized | 0 | 0 | 1 | 1 | Underflow |
| +zero | 0 | 0 | 0 | - |  |
| -zero | 0 | 0 | 0 | - |  |
| -denormalized | 0 | 0 | 1 | 1 | Underflow |
| -normalized | 0 | 1 | 0 | - |  |
| -infinite | 0 | 1 | 1 | 1 | Overflow |
| $-q N a N$ | 1 | 1 | 1 | 1 |  |

## Example

| STL |  |  | Explanation |
| :---: | :---: | :---: | :---: |
|  | L | MD10 | //The value from memory double word MD10 is loaded into ACCU 1. (This value must be in the floating-point format.) |
|  | TAN |  | //Calculate the tangent of the floating-point number (32-bit, IEEE-FP) in ACCU 1. Store the result in ACCU 1. |
|  | AN | OV | //Scan the ov bit in the status word for "0." |
|  | JC | OK | //If no error occurred during the TAN instruction, jump to the OK jump label. |
| BEU |  |  | //Block end unconditional, if an error occurred during the taN instruction. |
| OK: | T | MD20 | //Transfer the result from ACCU 1 to memory double word MD20. |

### 8.4.8 ASIN Generate the Arc Sine of a Floating-Point Number (32-Bit)

## Format

## ASIN

## Description of instruction

ASIN (generate the arc sine of a floating-point number, 32-bit, IEEE-FP) calculates the arc sine of a floating-point number in ACCU 1. Permissible value range for the input value
$-1<=$ input value <= +1
The result is an angle specified as a radian measure. The value is in the following range

$$
-\pi / 2<=\operatorname{arc} \text { sine }(\text { ACCU1 })<=+\pi / 2, \text { with } \pi=3.14159 \ldots
$$

The instruction influences the CC $1, \mathrm{CC} 0, \mathrm{OV}$, and OS status word bits.
The contents of accumulator 2 (and also the contents of accumulator 3 and accumulator 4 for CPUs with four ACCUs) remain unchanged.

## Result

| The result in ACCU 1 is | CC 1 | CC 0 | OV | OS | Note |
| :--- | :--- | :--- | :--- | :--- | :--- |
| + qNaN | 1 | 1 | 1 | 1 |  |
| +normalized | 1 | 0 | 0 | - |  |
| +denormalized | 0 | 0 | 1 | 1 | Overflow |
| +zero | 0 | 0 | 0 | - |  |
| -zero | 0 | 0 | 0 | - |  |
| -denormalized | 0 | 0 | 1 | 1 | Underflow |
| -normalized | 0 | 1 | 0 | - |  |
| -qNaN | 1 | 1 | 1 | 1 |  |

## Example

| STL |  |  | Explanation |
| :---: | :---: | :---: | :---: |
|  | L | MD10 | //The value from memory double word MD10 is loaded into ACCU 1. (This value must be in the floating-point format.) |
|  | AS |  | //Calculate the arc sine of the floating-point number (32-bit, IEEE-FP) in ACCU 1. Store the result in ACCU 1. |
|  | AN | OV | //Scan the ov bit in the status word for "0." |
|  | JC | OK | //If no error occurred during the ASIN instruction, jump to the OK jump label. |
| BE |  |  | //Block end unconditional, if an error occurred during the ASIN instruction. |
| OK: | T | MD20 |  |

### 8.4.9 ACOS Generate the Arc Cosine of a Floating-Point Number (32-Bit)

## Format

## ACOS

## Description of instruction

ACOS (generate the arc cosine of a floating-point number, 32-bit, IEEE-FP)
calculates the arc cosine of a floating-point number in ACCU 1. Permissible value range for the input value
$-1<=$ input value <= +1
The result is an angle specified in a radian measure. The value is located in the following range

$$
0<=\operatorname{arc} \text { cosine }(\text { ACCU1 })<=\pi \text {, with } \pi=3.14159 \ldots
$$

The instruction influences the CC $1, \mathrm{CC} 0, \mathrm{OV}$, and OS status word bits.
The contents of accumulator 2 (and the contents of accumulator 3 and accumulator 4 for CPUs with four ACCUs) remain unchanged.

## Result

| The result in ACCU 1 is | CC 1 | CC 0 | OV | OS | Note |
| :--- | :--- | :--- | :--- | :--- | :--- |
| + qNaN | 1 | 1 | 1 | 1 |  |
| +normalized | 1 | 0 | 0 | - |  |
| +denormalized | 0 | 0 | 1 | 1 | Overflow |
| +zero | 0 | 0 | 0 | - |  |
| -zero | 0 | 0 | 0 | - |  |
| -denormalized | 0 | 0 | 1 | 1 | Underflow |
| -normalized | 0 | 1 | 0 | - |  |
| -qNaN | 1 | 1 | 1 | 1 |  |

## Example

| STL |  |  | Explanation |
| :---: | :---: | :---: | :---: |
|  | L | MD10 | //The value from memory double word MD10 is loaded into ACCU 1. (This value must be in the floating-point format.) |
|  | ACOS |  | //Calculate the arc cosine of the floating-point number (32-bit, IEEE-FP) in ACCU 1. Store the result in ACCU 1. |
|  | AN | OV | //Scan the OV bit in the status word for "0." |
|  | JC | OK | //If no error occurred during the ACOS instruction, jump to the OK jump label. |
| BEU |  |  | //Block end unconditional, if an error occurred during the ACOS instruction. |
| OK: | T | MD20 | //Transfer the result from ACCU 1 to memory double word MD20. |

### 8.4.10 ATAN Generate the Arc Tangent of a Floating-Point Number (32-Bit)

## Format

## ATAN

## Description of instruction

ATAN (generate the arc tangent of a floating-point number, 32-bit, IEEE-FP) calculates the arc tangent of a floating-point number in ACCU 1.The result is an angle specified in a radian measure. The value is in the following range

$$
-\pi / 2<=\operatorname{arc} \text { tangent }(\text { ACCU } 1)<=+\pi / 2, \text { with } \pi=3.14159 \ldots
$$

Theinstruction influences the CC $1, \mathrm{CC} 0, \mathrm{OV}$, and OS status word bits.
The contents of accumulator 2 (and also the contents of accumulator 3 and accumulator 4 for CPUs with four ACCUs) remain unchanged.

## Result

| The result in ACCU 1 is | CC 1 | CC 0 | OV | OS | Note |
| :--- | :--- | :--- | :--- | :--- | :--- |
| + qNaN | 1 | 1 | 1 | 1 |  |
| +normalized | 1 | 0 | 0 | - |  |
| +denormalized | 0 | 0 | 1 | 1 | Overflow |
| +zero | 0 | 0 | 0 | - |  |
| -zero | 0 | 0 | 0 | - |  |
| -denormalized | 0 | 0 | 1 | 1 | Underflow |
| -normalized | 0 | 1 | 0 | - |  |
| -qNaN | 1 | 1 | 1 | 1 |  |

## Example

| STL |  | Explanation |
| :--- | :--- | :--- |
|  | L MD10 | //The value from memory double word MD10 is loaded into ACCU 1. (This <br> value must be in the floating-point format.) <br> //Calculate the arc tangent of the floating-point number (32-bit, |
|  | ATAN | IEEE-FP) in ACCU 1. Store the result in ACCU 1. |

## 9 Load and Transfer Instructions

### 9.1 Overview of Load and Transfer Instructions

## Description

The Load (L) and Transfer ( T ) instructions enable you to program an interchange of information between input or output modules and memory areas, or between memory areas. The CPU executes these instructions in each scan cycle as unconditional instructions, that is, they are not affected by the result of logic operation of a statement.
The following Load and Transfer instructions are available:

- L Load
- L STW Load Status Word into ACCU 1
- LAR1 AR2 Load Address Register 1 from Address Register 2
- LAR1 <D> Load Address Register 1 with Double Integer (32-Bit Pointer)
- LAR1 Load Address Register 1 from ACCU 1
- LAR2 <D> Load Address Register 2 with Double Integer (32-Bit Pointer)
- LAR2 Load Address Register 2 from ACCU 1
- T Transfer
- TSTW Transfer ACCU 1 into Status Word
- TAR1 AR2 Transfer Address Register 1 to Address Register 2
- TAR1 <D> Transfer Address Register 1 to Destination (32-Bit Pointer)
- TAR2 <D> Transfer Address Register 2 to Destination (32-Bit Pointer)
- TAR1 Transfer Address Register 1 to ACCU 1
- TAR2 Transfer Address Register 2 to ACCU 1
- CAR Exchange Address Register 1 with Address Register 2

### 9.2 L Load

## Format

## L <address>

| Address | Data type | Memory area | Source address |
| :--- | :--- | :--- | :--- |
| <address> | BYTE | E, A, PE, M, L, D, | $0 \ldots 65535$ |
|  | WORD | Pointer, Parameter | $0 \ldots 65534$ |
|  | DWORD |  | $0 \ldots 65532$ |

## Description

L <address> loads the addressed byte, word, or double word into ACCU 1 after the old contents of ACCU 1 have been saved into ACCU 2, and ACCU 1 is reset to " 0 ".

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Examples

| STL |  | Explanation |
| :--- | :--- | :--- |
| L | IB10 | //Load input byte IB10 into ACCU 1-L-L. |
| L | MB120 | //Load memory byte MB120 into ACCU 1-L-L. |
| L | DBB12 | //Load data byte DBB12 into ACCU 1-L-L. |
| L | DIW15 | //Load instance data word DIW15 into ACCU 1-L. |
| L | LD252 | //Load local data double word LD252 ACCU 1. |
| L | P\# I 8.7 | //Load the pointer into ACCU 1. |
| L | OTTO | //Load the parameter "OTTO" into ACCU 1. |
| L | P\# ANNA | //Load the pointer to the specified parameter in ACCU 1. (This instruction |
|  |  | loads the relative address offset of the specified parameter. To calculate <br> the absolute offset in the instance data block in multiple instance FBs, the |
|  |  | contents of the AR2 register must be added to this value. |

## Contents of ACCU 1

| Contents of ACCU 1 | ACCU1-H-H | ACCU1-H-L | ACCU1-L-H | ACCU1-L-L |  |
| :--- | :--- | :--- | :--- | :--- | :---: |
| before execution of load instruction | XXXXXXXX | XXXXXXXX | XXXXXXXX | XXXXXXXX |  |
| after execution of L MB10 (L <Byte>) | 00000000 | 00000000 | 00000000 | <MB10> |  |
| after execution of L MW10 (L <word>) | 00000000 | 00000000 | <MB10> | <MB11> |  |
| after execution of L MD10 <br> (L <double word>) | <MB10> | <MB11> | <MB12> | <MB13> |  |
| after execution of L P\# ANNA (in FB) | <86> | <Bit offset of ANNA relative to the FB start>. <br> To calculate the absolute offset in the <br> instance data block in multiple instance FBs, <br> the contents of the AR2 register must be <br> added to this value. |  |  |  |
| after execution of L P\# ANNA (in FC) | <An area-crossing address of the data which is transferred to <br> ANNA> |  |  |  |  |
|  | X="1" or "0" |  |  |  |  |

### 9.3 L STW Load Status Word into ACCU 1

## Format

## L STW

## Description

L STW (instruction L with the address STW) loads ACCU 1 with the contents of the status word. The instruction is executed without regard to, and without affecting, the status bits.

## Note

For the S7-300 series CPUs, the statement L STW does not load the FC, STA, and OR bits of the status word. Only bits $1,4,5,6,7$, and 8 are loaded into the corresponding bit positions of the low word of accumulator 1.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | STW | //Load contents of status word into ACCU 1. |

The contents of ACCU 1 after the execution of L STW is:

| Bit | $\mathbf{3 1 - 9}$ | $\mathbf{8}$ | $\mathbf{7}$ | $\mathbf{6}$ | $\mathbf{5}$ | $\mathbf{4}$ | $\mathbf{3}$ | $\mathbf{2}$ | $\mathbf{1}$ | $\mathbf{0}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Content: | 0 | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | /FC |

### 9.4 LAR1 Load Address Register 1 from ACCU 1

## Format

## LAR1

## Description

LAR1 loads address register AR1 with the contents of ACCU 1 (32-bit pointer). ACCU 1 and ACCU 2 remain unchanged. The instruction is executed without regard to, and without affecting, the status bits.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

### 9.5 LAR1 <D> Load Address Register 1 with Double Integer (32-Bit Pointer)

## Format

LAR1 <D>

| Address | Data type | Memory area | Source address |
| :--- | :--- | :--- | :--- |
| <D> | DWORD <br> pointer constant | D, M, L | $0 \ldots 65532$ |

## Description

LAR1 <D> loads address register AR1 with the contents of the addressed double word <D> or a pointer constant. ACCU 1 and ACCU 2 remain unchanged. The instruction is executed without regard to, and without affecting, the status bits.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example: Direct addresses

| STL |  | Explanation |
| :--- | :--- | :--- |
| LAR1 | DBD20 | //Load AR1 with the pointer in data double word DBD20. |
| LAR1 | DID30 | //Load AR1 with the pointer in instance data double word DID30. |
| LAR1 | LD180 | //Load AR1 with the pointer in local data double word LD180. |
| LAR1 | MD24 | //Load AR1 with the contents of memory double word MD24. |

## Example: Pointer constant

| STL | Explanation |  |
| :--- | :--- | :--- |
| LAR1 | P\#M100.0 | //Load AR1 with a 32-bit pointer constant. |

### 9.6 LAR1 AR2 Load Address Register 1 from Address Register 2

Format

## LAR1 AR2

## Description

LAR1 AR2 (instruction LAR1 with the address AR2) loads address register AR1 with the contents of address register AR2. ACCU 1 and ACCU 2 remain unchanged. The instruction is executed without regard to, and without affecting, the status bits.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

### 9.7 LAR2 Load Address Register 2 from ACCU 1

## Format

LAR2

## Description

LAR2 loads address register AR2 with the contents ACCU 1 (32-bit pointer).
ACCU 1 and ACCU 2 remain unchanged. The instruction is executed without regard to, and without affecting, the status bits.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

### 9.8 LAR2 <D> Load Address Register 2 with Double Integer (32-Bit Pointer)

## Format

LAR2 <D>

| Address | Data type | Memory area | Source address |
| :--- | :--- | :--- | :--- |
| <D> | DWORD <br> pointer constant | D, M, L | $0 \ldots 65532$ |

## Description

LAR2 <D> loads address register AR2 with the contents of the addressed double word <D> or a pointer constant. ACCU 1 and ACCU 2 remain unchanged. The instruction is executed without regard to, and without affecting, the status bits.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example: Direct addresses

| STL | Explanation |  |
| :--- | :--- | :--- |
| LAR2 | DBD 20 | //Load AR2 with the pointer in data double word DBD20. |
| LAR2 | DID 30 | //Load AR2 with the pointer in instance data double word DID30. |
| LAR2 | LD 180 | //Load AR2 with the pointer in local data double word LD180. |
| LAR2 | MD 24 | //Load AR2 with the pointer in memory double word MD24. |

## Example: Pointer constant

| STL | Explanation |  |
| :--- | :--- | :--- |
| LAR2 | P\#M100.0 | //Load AR2 with a 32-bit pointer constant. |

## $9.9 \quad$ T Transfer

## Format

## T <address>

| Address | Data type | Memory area | Source address |
| :--- | :--- | :--- | :--- |
| <address> | BYTE | I, Q, PQ, M, L, D | $0 \ldots 65535$ |
|  | WORD |  | $0 \ldots 65534$ |
|  | DWORD |  | $0 \ldots 65532$ |

## Description

T <address> transfers (copies) the contents of ACCU 1 to the destination address if the Master Control Relay is switched on ( $M C R=1$ ). If $M C R=0$, then the destination address is written with 0 . The number of bytes copied from ACCU 1 depends on the size expressed in the destination address. ACCU 1 also saves the data after the transfer procedure. A transfer to the direct I/O area (memory type PQ) also transfers the contents of ACCU 1 or " 0 " (if MCR=0) to the corresponding address of the process image output table (memory type Q ). The instruction is executed without regard to, and without affecting, the status bits.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Examples

| STL | Explanation |  |
| :--- | :--- | :--- |
| $\mathbf{T}$ | QB10 | //Transfers contents of ACCU 1-L-L to output byte QB10. |
| T | MW14 | //Transfers contents of ACCU 1-L to memory word MW14. |
| T | DBD2 | //Transfers contents of ACCU 1 to data double word DBD2. |

### 9.10 T STW Transfer ACCU 1 into Status Word

## Format

T STW

## Description

T STW (instruction T with the address STW) transfers bit 0 to bit 8 of ACCU 1 into the status word.
The instruction is executed without regard to the status bits.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | x | x | x | x | x | x | x | x | x |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| T | STW | //Transfer bit 0 to bit 8 from ACCU 1 to the status word. |

The bits in ACCU 1 contain the following status bits:

| Bit | $\mathbf{3 1 - 9}$ | $\mathbf{8}$ | $\mathbf{7}$ | $\mathbf{6}$ | $\mathbf{5}$ | $\mathbf{4}$ | $\mathbf{3}$ | $\mathbf{2}$ | $\mathbf{1}$ | $\mathbf{0}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Content: | *) | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | /FC |

*) bits are not transferred.

### 9.11 CAR Exchange Address Register 1 with Address Register 2

## Format

## CAR

## Description

CAR (swap address register) exchanges the contents of address registers AR1 and AR2. The instruction is executed without regard to, and without affecting, the status bits.

The contents of address register AR1 are moved to address register AR2 and the contents of address register AR2 are moved to address register AR1.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

### 9.12 TAR1 Transfer Address Register 1 to ACCU 1

## Format

## TAR1

## Description

TAR1 transfers the contents of address register AR1 into ACCU 1 (32-bit pointer). The previous contents of ACCU 1 are saved into ACCU 2. The instruction is executed without regard to, and without affecting, the status bits.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

### 9.13 TAR1 <D> Transfer Address Register 1 to Destination (32-Bit Pointer)

## Format

TAR1 <D>

| Address | Data type | Memory area | Source address |
| :--- | :--- | :--- | :--- |
| <D> | DWORD | $\mathrm{D}, \mathrm{M}, \mathrm{L}$ | $0 \ldots 65532$ |

## Description

TAR1 <D> transfers the contents of address register AR1 into the addressed double word <D>. Possible destination areas are memory double words (MD), local data double words (LD), data double words (DBD), and instance data words (DID).

ACCU 1 and ACCU 2 remain unchanged. The instruction is executed without regard to, and without affecting, the status bits.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Examples

| STL | Explanation |  |
| :--- | :--- | :--- |
| TAR1 | DBD20 | //Transfer the contents of AR1 into data double word DBD20. |
| TAR1 | DID30 | //Transfer the contents of AR1 into instance data double word DID30. |
| TAR1 | LD18 | //Transfer the contents of AR1 into local data double word LD18. |
| TAR1 | MD24 | //Transfer the contents of AR1 into memory double word MD24. |

### 9.14 TAR1 AR2 Transfer Address Register 1 to Address Register 2

## Format

TAR1 AR2

## Description

TAR1 AR2 (instruction TAR1 with the address AR2) transfers the contents of address register AR1 to address register AR2.

ACCU 1 and ACCU 2 remain unchanged. The instruction is executed without regard to, and without affecting, the status bits.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

### 9.15 TAR2 Transfer Address Register 2 to ACCU 1

## Format

## TAR2

## Description

TAR2 transfers the contents of address register AR2 into ACCU 1 (32-bit pointer). The contents of ACCU 1 were previously saved into ACCU 2. The instruction is executed without regard to, and without affecting, the status bits.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

### 9.16 TAR2 <D> Transfer Address Register 2 to Destination (32-Bit Pointer)

## Format

TAR2 < D >

| Address | Data type | Memory area | Source address |
| :--- | :--- | :--- | :--- |
| $<D>$ | DWORD | $D, M, L$ | $0 \ldots 65532$ |

## Description

TAR2 <D> transfers the contents of address register AR2 to the addressed double word <D>. Possible destination areas are memory double words (MD), local data double words (LD), data double words (DBD), and instance double words (DID).

ACCU 1 and ACCU 2 remain unchanged. The instruction is executed without regard to, and without affecting, the status bits.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Examples

| STL | Explanation |  |
| :--- | :--- | :--- |
| TAR2 | DBD20 | //Transfer the contents of AR2 to data double word DBD20. |
| TAR2 | DID30 | //Transfer the contents of AR2 to instance double word DID30. |
| TAR2 | LD18 | //Transfer the contents of AR2 into local data double word LD18. |
| TAR2 | MD24 | //Transfer the contents of AR2 into memory double word MD24. |

## 10 Program Control Instructions

### 10.1 Overview of Program Control Instructions

## Description

The following instructions are available for performing program control instructions:

- BE Block End
- BEC Block End Conditional
- BEU Block End Unconditional
- CALL Block Call
- CC Conditional Call
- UC Unconditional Call
- Call FB
- Call FC
- Call SFB
- Call SFC
- Call Multiple Instance
- Call Block from a Library
- MCR (Master Control Relay)
- Important Notes on Using MCR Functions
- MCR( Save RLO in MCR Stack, Begin MCR
- )MCR End MCR
- MCRA Activate MCR Area
- MCRD Deactivate MCR Area

### 10.2 BE Block End

## Format

## BE

## Description

BE (block end) terminates the program scan in the current block and causes a jump to the block that called the current block. The program scan resumes with the first instruction that follows the block call statement in the calling program. The current local data area is released and the previous local data area becomes the current local data area. The data blocks that were opened when the block was called are re-opened. In addition, the MCR dependency of the calling block is restored and the RLO is carried over from the current block to the block that called the current block. $B E$ is not dependent on any conditions. However, if the BE instruction is jumped over, the current program scan does not end and will continue starting at the jump destination within the block.

The BE instruction is not identical to the S 5 software. The instruction has the same function as BEU when used on S7 hardware.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | 0 | 0 | 1 | - | 0 |

## Example

| STL |  |  | Explanation |
| :---: | :---: | :---: | :---: |
|  | A | I 1.0 |  |
|  | JC | NEXT | //Jump to NEXT jump label if RLO = 1 ( 1.0 = 1). |
|  | L | IW4 | //Continue here if no jump is executed. |
|  | T | IW10 |  |
|  | A | I 6.0 |  |
|  | A | I 6.1 |  |
|  | S | M 12.0 |  |
|  | BE |  | //Block end |
| NEXT : | NOP |  | //Continue here if jump is executed. |
|  | 0 |  |  |

### 10.3 BEC Block End Conditional

## Format

## BEC

## Description

If RLO = 1, then BEC (block end conditional) interrupts the program scan in the current block and causes a jump to the block that called the current block. The program scan resumes with the first instruction that follows the block call. The current local data area is released and the previous local data area becomes the current local data area. The data blocks that were current data blocks when the block was called are re-opened. The MCR dependency of the calling block is restored.

The RLO (= 1 ) is carried over from the terminated block to the block that called. If RLO $=0$, then BEC is not executed. The RLO is set to 1 and the program scan continues with the instruction following BEC.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | $x$ | 0 | 1 | 1 | 0 |

## Example

| STL | Explanation |  |  |
| :--- | :--- | :--- | :---: |
| A 1.0 | //Update RLO. |  |  |
| BEC |  | //End block if RLO $=1$. |  |
| L | IW4 | //Continue here if BEC is not executed, RLO $=0$. |  |
| T MW10 |  |  |  |

### 10.4 BEU Block End Unconditional

## Format

```
BEU
```

## Description

BEU (block end unconditional) terminates the program scan in the current block and causes a jump to the block that called the current block. The program scan resumes with the first instruction that follows the block call. The current local data area is released and the previous local data area becomes the current local data area. The data blocks that were opened when the block was called are re-opened. In addition, the MCR dependency of the calling block is restored and the RLO is carried over from the current block to the block that called the current block. BEU is not dependent on any conditions. However, if the BEU instruction is jumped over, the current program scan does not end and will continue starting at the jump destination within the block.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | 0 | 0 | 1 | - | 0 |

## Example

| STL | Explanation |  |  |  |
| :--- | :--- | :--- | :--- | :---: |
|  | A | I 1.0 |  |  |
|  | JC | NEXT | //Jump to NEXT jump label if RLO = 1 (I 1.0 $=1)$. |  |
|  | L | IW4 | //Continue here if no jump is executed. |  |
|  | T | IW10 |  |  |
|  | A | I 6.0 |  |  |
|  | A | I 6.1 |  |  |
|  | S | M 12.0 |  |  |
|  | BEU |  | //Block end unconditional. |  |
| NEXT: | NOP 0 |  | //Continue here if jump is executed. |  |

### 10.5 CALL Block Call

## Format

## CALL <logic block identifier>

## Description

CALL <logic block identifier> is used to call functions (FCs) or function blocks (FBs), system functions (SFCs) or system function blocks (SFBs) or to call the standard pre-programmed blocks shipped by Siemens. The CALL instruction calls the FC and SFC or the FB and SFB that you input as an address, independent of the RLO or any other condition. If you call an FB or SFB with CALL, you must provide the block with an associated instance DB. The calling block program continues logic processing after the called block is processed. The address for the logic block can be specified absolutely or symbolically. Register contents are restored after an SFB/SFC call.

## Example: CALL FB1, DB1 or CALL FILLVAT1, RECIPE1

| Logic Block | Block Type | Absolute Address Call <br> Syntax |
| :--- | :--- | :--- |
| FC | Function | CALL FCn |
| SFC | System function | CALL SFCn |
| FB | Function block | CALL FBn1,DBn2 |
| SFB | System function block | CALL SFBn1,DBn2 |

## Note

When you use the STL Editor, the references ( $n, n 1$, and $n 2$ ) in the table above must refer to valid existing blocks. Likewise, symbolic names must be defined prior to use.

## Passing parameters (incremental edit mode)

The calling block can exchange parameters with the called block via a variable list. The variable list is extended automatically in your STL program when you enter a valid CALL statement.

If you call an FB, SFB, FC or SFC and the variable declaration table of the called block has IN, OUT, and IN_OUT declarations, these variables are added in the calling block as a formal parameter list.

When FCs and SFCs are called, you must assign actual parameters from the calling logic block to the formal parameters.

When you call FBs and SFBs, you must specify only the actual parameters that must be changed from the previous call. After the FB is processed, the actual parameters are stored in the instance DB. If the actual parameter is a data block, the complete, absolute address must be specified, for example DB1, DBW2.

The IN parameters can be specified as constants or as absolute or symbolic addresses. The OUT and IN_OUT parameters must be specified as absolute or symbolic addresses. You must ensure that all addresses and constants are compatible with the data types to be transferred.

CALL saves the return address (selector and relative address), the selectors of the two current data blocks, as well as the MA bit in the B (block) stack. In addition, CALL deactivates the MCR dependency, and then creates the local data area of the block to be called.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | 0 | 0 | 1 | - | 0 |

## Example 1: Assigning parameters to the FC6 call

| CALL | FC6 |  |
| :--- | :--- | :--- |
|  | Formal parameter | Actual parameter |
| NO OF TOOL | $:=$ MW100 |  |
| TIME OUT | $:=$ MW110 |  |
| FOUND | $:=$ Q 0.1 |  |
| ERROR | $:=$ Q 100.0 |  |

## Example 2: Calling an SFC without parameters

| STL | Explanation |  |
| :--- | :--- | :--- |
| CALL | SFC43 | //Call SFC43 to re-trigger watchdog timer (no parameters). |

## Example 3: Calling FB99 with instance data block DB1

```
CALL | FB99,DB1
    Formal parameter Actual parameter
        MAX_RPM := #RPM1_MAX
        MIN_RPM := #RPM1
        MAX_POWER := #POWER1
        MAX_TEMP := #TEMP1
```

## Example 4: Calling FB99 with instance data block DB2

CALL FB99, DB2
Formal parameter Akcual parameter
MAX_RPM := \#RPM2_MAX
MIN_RPM := \#RPM2
MAX_POWER := \#POWER2
MAX_TEMP := \#TEMP2

## Note

Every FB or SFB CALL must have an instance data block. In the example above, the blocks DB1 and DB2 must already exist before the call.

### 10.6 Call FB

## Format

CALL FB n1, DB n1

## Description

This instruction is intended to call user-defined function blocks (FBs). The CALL instruction calls the function block you entered as address, independent of the RLO or other conditions. If you call a function block with CALL, you must provide it with an instance data block. After processing the called block, processing continues with the program for the calling block. The address for the logic block can be specified absolutely or symbolically.

## Passing parameters (incremental edit mode)

The calling block can exchange parameters with the called block via the variable list. The variable list is extended automatically in your Statement List program when you enter a valid CALL instruction.

If you call a function block and the variable declaration table of the called block has IN, OUT, and IN_OUT declarations, these variables are added in the program for the calling block as a list of formal parameters.

When calling the function block, you only need to specify the actual parameters that must be changed from the previous call because the actual parameters are saved in the instance data block after the function block is processed. If the actual parameter is a data block, the complete, absolute address must be specified, for example DB1, DBW2.

The IN parameters can be specified as constants or as absolute or symbolic addresses. The OUT and IN_OUT parameters must be specified as absolute or symbolic addresses. You must ensure that all addresses and constants are compatible with the data types to be transferred.
CALL saves the return address (selector and relative address), the selectors of the two open data blocks, and the MA bit in the B (block) stack. In addition, CALL deactivates the MCR dependency, and then creates the local data area of the block to be called.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | 0 | 0 | 1 | - | 0 |

## Example 1: FB99 call with instance data block DB1

```
CALL FB99,DB1
    Formal parameter Actual parameter
    MAX_RPM := #RPM1_MAX
    MIN_RPM := #RPM1
    MAX_POWER := #POWER1
    MAX_TEMP := #TEMP1
```

Example 2: FB99 call with instance data block DB2

| CALL | FB99,DB2 |  |
| :--- | :--- | :--- |
|  | Formal parameter | Actual parameter |
|  | MAX_RPM | $:=$ \#RPM2_MAX |
|  | MIN_RPM | $:=$ \#RPM2 |
|  | MAX_POWER | $:=$ \#POWER2 |
|  | MAX_TEMP | $:=$ \#TEMP2 |

## Note

Every function block CALL must have an instance data block. In the example above, the blocks DB1 and DB2 must already exist before the call.

### 10.7 Call FC

## Format

## CALL FC n

## Note

If you are working in the STL Editor, the reference ( $n$ ) must relate to existing valid blocks. You must also define the symbolic names prior to use.

## Description

This instruction is intended to call functions (FCs). The CALL instruction calls the FC that you entered as address, independent of the RLO or other conditions. After processing the called block, processing continues with the program for the calling block. The address for the logic block can be specified absolutely or symbolically.

## Passing parameters (incremental edit mode)

The calling block can exchange parameters with the called block via the variable list. The variable list is extended automatically in your Statement List program when you enter a valid CALL instruction.

If you call a function and the variable declaration table of the called block has IN , OUT, and IN_OUT declarations, these variables are added in the program for the calling block as a list of formal parameters.
When calling the function, you must assign actual parameters in the calling logic block to the formal parameters.

The IN parameters can be specified as constants or as absolute or symbolic addresses. The OUT and IN_OUT parameters must be specified as absolute or symbolic addresses. You must ensure that all addresses and constants are compatible with the data types to be transferred.

CALL saves the return address (selector and relative address), the selectors of the two open data blocks, and the MA bit in the B (block) stack. In addition, CALL deactivates the MCR dependency, and then creates the local data area of the block to be called.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | 0 | 0 | 1 | - | 0 |

## Example: Assigning parameters to the FC6 call

CALL FC6

| Formal parameter | Actual parameter |
| :--- | :--- |
| NO OF TOOL | $:=$ MW100 |
| TIME OUT | $:=$ MW110 |
| FOUND | $:=$ Q0.1 |
| ERROR | $:=$ Q100.0 |

### 10.8 Call SFB

## Format

CALL SFB n1, DB n2

## Description

This instruction is intended to call the standard function blocks (SFBs) supplied by Siemens. The CALL instruction calls the SFB that you entered as address, independent of the RLO or other conditions. If you call a system function block with CALL, you must provide it with an instance data block. After processing the called block, processing continues with the program for the calling block. The address for the logic block can be specified absolutely or symbolically.

## Passing parameters (incremental edit mode)

The calling block can exchange parameters with the called block via the variable list. The variable list is extended automatically in your Statement List program when you enter a valid CALL instruction.

If you call a system function block and the variable declaration table of the called block has IN, OUT, and IN_OUT declarations, these variables are added in the program for the calling block as a list of formal parameters.

When calling the system function block, you only need to specify the actual parameters that must be changed from the previous call because the actual parameters are saved in the instance data block after the system function block is processed. If the actual parameter is a data block, the complete, absolute address must be specified, for example DB1, DBW2.

The IN parameters can be specified as constants or as absolute or symbolic addresses. The OUT and IN_OUT parameters must be specified as absolute or symbolic addresses. You must ensure that all addresses and constants are compatible with the data types to be transferred.
CALL saves the return address (selector and relative address), the selectors of the two open data blocks, and the MA bit in the B (block) stack. In addition, CALL deactivates the MCR dependency, and then creates the local data area of the block to be called.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | 0 | 0 | 1 | - | 0 |

## Example

| CALL | SFB4, DB4 |  |
| :--- | :--- | :--- |
|  | Formal parameter | Actual parameter |
|  | IN: | I0.1 |
|  | PT: | T\#20s |
|  | Q: | M0.0 |
|  | ET: | MW10 |

## Note

Every system function block CALL must have an instance data block. In the example above, the blocks SFB4 and DB4 must already exist before the call.

### 10.9 Call SFC

## Format

CALL SFC n

## Note

If you are working in the STL Editor, the reference ( $n$ ) must relate to existing valid blocks. You must also define the symbolic names prior to use.

## Description

This instruction is intended to call the standard functions (SFCs) supplied by Siemens. The CALL instruction calls the SFC that you entered as address, independent of the RLO or other conditions. After processing the called block, processing continues with the program for the calling block. The address for the logic block can be specified absolutely or symbolically.

## Passing parameters (incremental edit mode)

The calling block can exchange parameters with the called block via the variable list. The variable list is extended automatically in your Statement List program when you enter a valid CALL instruction.

If you call a system function and the variable declaration table of the called block has IN, OUT, and IN_OUT declarations, these variables are added in the program for the calling block as a list of formal parameters.

When calling the system function, you must assign actual parameters in the calling logic block to the formal parameters.

The IN parameters can be specified as constants or as absolute or symbolic addresses. The OUT and IN_OUT parameters must be specified as absolute or symbolic addresses. You must ensure that all addresses and constants are compatible with the data types to be transferred.
CALL saves the return address (selector and relative address), the selectors of the two open data blocks, and the MA bit in the B (block) stack. In addition, CALL deactivates the MCR dependency, and then creates the local data area of the block to be called.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | 0 | 0 | 1 | - | 0 |

## Example: Calling an SFC without parameters

| STL | Explanation |  |
| :--- | :--- | :--- |
| CALL | SFC43 | //Call SFC43 to re-trigger watchdog timer (no parameters). |

### 10.10 Call Multiple Instance

## Format

## CALL \# variable name

## Description

A multiple instance is created by declaring a static variable with the data type of a function block. Only multiple instances that have already been declared are included in the program element catalog.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | 0 | 0 | $x$ | $x$ | $x$ |

### 10.11 Call Block from a Library

The libraries available in the SIMATIC Manager can be used here to select a block that

- Is integrated in your CPU operating system ("Standard Library")
- You saved in a library in order to use it again.

### 10.12 CC Conditional Call

## Format

## CC <logic block identifier>

## Description

CC <logic block identifier> (conditional block call) calls a logic block if RLO=1. CC is used to call logic blocks of the FC or FB type without parameters. CC is used in the same way as the CALL instruction except that you cannot transfer parameters with the calling program. The instruction saves the return address (selector and relative address), the selectors of the two current data blocks, as well as the MA bit into the B (block) stack, deactivates the MCR dependency, creates the local data area of the block to be called, and begins executing the called code. The address for the logic block can be specified absolutely or symbolically.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | 0 | 0 | 1 | 1 | 0 |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| A 2.0 | //Check signal state at input I 2.0. |  |
| CC | FC6 | //Call function FC6 if I 2.0 is "1". |
| A 3.0 | //Executed upon return from called function $(12.0=1)$ or directly after |  |
|  |  | A I 2.0 statement if $12.0=0$. |

## Note

If the CALL instruction calls a function block (FB) or a system function block (SFB), an instance data block (DB no.) must be specified in the statement. For a call with the CC instruction, you cannot assign a data block to the address in the statement.
Depending on the network you are working with, the Program Editor either generates the UC instruction or the CC instruction during conversion from the Ladder Logic programming language to the Statement List programming language. You should attempt to use the CALL instruction instead to avoid errors occurring in your programs.

### 10.13 UC Unconditional Call

## Format

## UC <logic block identifier>

## Description

UC <logic block identifier> (unconditional block call) calls a logic block of the FC or SFC type. UC is like the CALL instruction, except that you cannot transfer parameters with the called block. The instruction saves the return address (selector and relative address) selectors of the two current data blocks, as well as the MA bit into the B (block) stack, deactivates the MCR dependency, creates the local data area of the block to be called, and begins executing the called code.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | 0 | 0 | 1 | - | 0 |

## Example 1

| STL | Explanation |
| :--- | :--- | :--- |
| UC FC6 | //Call function FC6 (without parameters). |

## Example 2

| STL | Explanation |  |
| :--- | :--- | :--- |
| UC | SFC43 | //Call system function SFC43 (without parameters). |

## Note

When the CALL instruction is used for a function block (FB) or system function block (SFB) an instance data block (DB no.) is expressed explicitly in the instruction. For a call made with the UC instruction, you cannot associate a data block in the UC address

Depending on the network you are working with, the Program Editor either generates the UC instruction or the CC instruction during conversion from the Ladder Logic programming language to the Statement List programming language. You should attempt to use the CALL instruction instead to avoid errors occurring in your programs.

### 10.14 MCR (Master Control Relay)

Important Notes on Using MCR Functions

## Warning

To prevent personal injury or property damage, never use the MCR to replace a hard-wired mechanical master control relay for an emergency stop function.

## Description

The Master Control Relay (MCR) is a relay ladder logic master switch for energizing and de-energizing power flow. Instructions triggered by the following bit logic and transfer instructions are dependent on the MCR:

- = <bit>
- S <bit>
- $\mathbf{R}$ <bit>
- $\mathbf{T}$ <byte>, $\mathbf{T}$ <word>, $\mathbf{T}$ <double word>

The $\mathbf{T}$ instruction, used with byte, word, and double word, writes a 0 to the memory if the MCR is 0 . The $\mathbf{S}$ and $\mathbf{R}$ instructions leave the existing value unchanged. The instruction = writes " 0 " in the addressed bit.

## Instructions dependent on MCR and their reactions to the signal state of the MCR

| Signal State <br> of MCR | $=$ <bit> | $\mathbf{S}$ <bit>, $\mathbf{R}$ <bit> | $\mathbf{T}$ <byte>, $\mathbf{T}$ <word> <br> $\mathbf{T}$ <double word> |
| :--- | :--- | :--- | :--- |
| $\mathbf{0}$ ("OFF") | Writes 0. <br> (Imitates a relay that <br> falls to its quiet state <br> when voltage is <br> removed.) | Does not write. <br> (Imitates a relay that <br> remains in its current <br> state when voltage is <br> removed.) | Writes 0. <br> (Imitates a component <br> that produces a value <br> of 0 when voltage is <br> removed.) |
| $\mathbf{1}$ ("ON") | Normal processing | Normal processing | Normal processing |

## MCR( - Begin MCR Area, )MCR - End MCR Area

The MCR is controlled by a stack one bit wide and eight bits deep. The MCR is energized as long as all eight entries are equal to 1. The MCR( instruction copies the RLO bit into the MCR stack. The )MCR instruction removes the last entry from the stack and sets the vacated position to 1. MCR( and )MCR instructions must always be used in pairs. A fault, that is, if there are more than eight consecutive MCR( instructions or an attempt is made to execute an )MCR instruction when the MCR stack is empty, triggers the MCRF error message.

## MCRA - Activate MCR Area, MCRD - Deactivate MCR Area

MCRA and MCRD must always be used in pairs. Instructions programmed between MCRA and MCRD are dependent on the state of the MCR bit. The instructions that are programmed outside a MCRA-MCRD sequence are not dependent on the MCR bit state.

You must program the MCR dependency of functions (FCs) and function blocks (FBs) in the blocks themselves by using the MCRA instruction in the called block.

### 10.15 Important Notes on Using MCR Functions

Take care with blocks in which the Master Control Relay was activated with MCRA

- If the MCR is deactivated, the value 0 is written by all assignments $(T,=)$ in program segments between MCR( and )MCR.
- The MCR is deactivated if the RLO was = 0 before an MCR( instruction.

## Danger: PLC in STOP or undefined runtime characteristics!

The compiler also uses write access to local data behind the temporary variables defined in VAR_TEMP for calculating addresses. This means the following command sequences will set the PLC to STOP or lead to undefined runtime characteristics:

## Formal parameter access

- Access to components of complex FC parameters of the type STRUCT, UDT, ARRAY, STRING
- Access to components of complex FB parameters of the type STRUCT, UDT, ARRAY, STRING from the IN_OUT area in a block with multiple instance capability (version 2 block).
- Access to parameters of a function block with multiple instance capability (version 2 block) if its address is greater than 8180.0.
- Access in a function block with multiple instance capability (version 2 block) to a parameter of the type BLOCK_DB opens DB0. Any subsequent data access sets the CPU to STOP. T 0, C 0, FC0, or FB0 are also always used for TIMER, COUNTER, BLOCK_FC, and BLOCK_FB.

## Parameter passing

- Calls in which parameters are passed.

## LAD/FBD

- T branches and midline outputs in Ladder or FBD starting with RLO $=0$.

## Remedy

Free the above commands from their dependence on the MCR:

1. Deactivate the Master Control Relay using the MCRD instruction before the statement or network in question.
2. Activate the Master Control Relay again using the MCRA instruction after the statement or network in question.

# 10.16 MCR( Save RLO in MCR Stack, Begin MCR <br> Important Notes on Using MCR Functions 

## Format

## MCR(

## Description

MCR( (open an MCR area) saves the RLO on the MCR stack and opens a MCR area. The MCR area is the instructions between the instruction MCR( and the corresponding instruction )MCR. The instruction MCR( must always be used in combination with the instruction )MCR.

If RLO=1, then the MCR is "on." The MCR-dependent instructions within this MCR zone execute normally.

If $\mathrm{RLO}=0$, then the MCR is "off."
The MCR-dependent instructions within this MCR zone execute according to the table below.

## Instructions dependent on MCR Bit State

| Signal State <br> of MCR | $=$ <bit> | $\mathbf{S}$ <bit>, $\mathbf{R}$ <bit> | $\mathbf{T}$ <byte>, $\mathbf{T}$ <word> <br> $\mathbf{T}$ <double word> |
| :--- | :--- | :--- | :--- |
| $\mathbf{0}$ ("OFF") | Writes 0. <br> (Imitates a relay that <br> falls to its quiet state <br> when voltage is <br> removed.) | Does not write. <br> (Imitates a relay that <br> remains in its current <br> state when voltage is <br> removed.) | Writes 0. <br> (Imitates a component <br> that produces a value <br> of 0 when voltage is <br> removed.) |
| $\mathbf{1}$ ("ON") | Normal processing | Normal processing | Normal processing |

The MCR( and )MCR instructions can be nested. The maximum nesting depth is eight instructions. The maximum number of possible stack entries is eight. Execution of MCR( with the stack full produces a MCR Stack Fault (MCRF).

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | 1 | - | 0 |

## Example

| STL |  | Explanation |
| :---: | :---: | :---: |
| MCRA |  | //Activate MCR area. |
| A | I 1.0 |  |
| MCR( |  | //Save RLO in MCR stack, open MCR area. MCR = "on" when RLO=1 (1 1.0 ="1"); MCR = "off" when RLO=0 (I 1.0 ="0") |
| A | I 4.0 |  |
| $=$ | Q 8.0 | //If MCR = "off", then Q 8.0 is set to "0" regardless of 14.0. |
| L | MW20 |  |
| T | QW10 | //If MCR = "off", then "0" is transferred to QW10. |
| ) MCR |  | //End MCR area. |
| MCRD |  | //Deactivate MCR area. |
| A | I 1.1 |  |
| = | Q 8.1 | //These instructions are outside of the MCR area and are not dependent upon the MCR bit. |

### 10.17 )MCR End MCR

Important Notes on Using MCR Functions

## Format

## )MCR

## Description

)MCR (end an MCR area) removes an entry from the MCR stack and ends an MCR area. The last MCR stack location is freed up and set to 1 . The instruction MCR( must always be used in combination with the instruction )MCR. Execution of an )MCR instruction with the stack empty produces a MCR Stack Fault (MCRF).

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

| MCRD |  | //Deactivate MCR area. |
| A | I 1.1 |  |
| $=$ | Q 8.1 | //These instructions are outside of the MCR area and are not dependent upon the MCR bit. |

### 10.18 MCRA Activate MCR Area

Important Notes on Using MCR Functions

## Format

## MCRA

## Description

MCRA (Master Control Relay Activation) energizes the MCR dependency for the instructions following after it. The instruction MCRA must always be used in combination with the instruction MCRD (Master Control Relay Deactivation). The instructions programmed between MCRA and MCRD are dependent upon the signal state of the MCR bit.

The instruction is executed without regard to, and without affecting, the status word bits.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

```
STL Explanation
MCRA //Activate MCR area.
A I 1.0
MCR( //Save RLO in MCR stack, open MCR area. MCR = "on" when RLO=1 (I 1.0 ="1");
MCR = "Off" when RLO=0 (I 1.0 ="0")
A I 4.0
= Q 8.0 //If MCR = "off," then Q 8.0 is set to "0" regardless of I 4.0.
L MW20
T QW10 //If MCR = "off," then "0" is transferred to QW10.
)MCR //End MCR area.
MCRD //Deactivate MCR area.
A I 1.1
= Q 8.1 //These instructions are outside of the MCR area and are not dependent upon
    the MCR bit.
```

### 10.19 MCRD Deactivate MCR Area

Important Notes on Using MCR Functions

## Format

## MCRD

## Description

MCRD (Master Control Relay Deactivation) de-energizes the MCR dependency for the instructions following after it. The instruction MCRA (Master Control Relay Activation) must always be used in combination with the instruction MCRD (Master Control Relay Deactivation). The instructions that are programmed between MCRA and MCRD are dependent upon the signal state of the MCR bit.

The instruction is executed without regard to, and without affecting, the status word bits.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

## Example

```
STL Explanation
MCRA //Activate MCR area.
A I 1.0
MCR( //Save RLO in MCR stack, open MCR area. MCR = "on" when RLO=1 (I 1.0 ="1");
MCR = "off" when RLO=0 (I 1.0 ="0")
A I 4.0
= Q 8.0 //If MCR = "off", then Q 8.0 is set to "0" regardless of I 4.0.
L MW20
T QW10 //If MCR = "off", then "0" is transferred to QW10.
)MCR //End MCR area.
MCRD //Deactivate MCR area.
A I 1.1
= Q 8.1 //These instructions are outside of the MCR area and are not dependent upon
    the MCR bit.
```

## 11 Shift and Rotate Instructions

### 11.1 Shift Instructions

### 11.1.1 Overview of Shift Instructions

## Description

You can use the Shift instructions to move the contents of the low word of accumulator 1 or the contents of the whole accumulator bit by bit to the left or the right (see also CPU Registers). Shifting by n bits to the left multiplies the contents of the accumulator by " 2 n "; shifting by n bits to the right divides the contents of the accumulator by " 2 n ". For example, if you shift the binary equivalent of the decimal value 3 to the left by 3 bits, you end up with the binary equivalent of the decimal value 24 in the accumulator. If you shift the binary equivalent of the decimal value 16 to the right by 2 bits, you end up with the binary equivalent of the decimal value 4 in the accumulator.

The number that follows the shift instruction or a value in the low byte of the low word of accumulator 2 indicates the number of bits by which to shift. The bit places that are vacated by the shift instruction are either filled with zeros or with the signal state of the sign bit (a 0 stands for positive and a 1 stands for negative). The bit that is shifted last is loaded into the CC 1 bit of the status word. The CC 0 and OV bits of the status word are reset to 0 . You can use jump instructions to evaluate the CC 1 bit. The shift operations are unconditional, that is, their execution does not depend on any special conditions. They do not affect the result of logic operation.

The following Shift instructions are available:

- SSI Shift Sign Integer (16-Bit)
- SSD Shift Sign Double Integer (32-Bit)
- SLW Shift Left Word (16-Bit)
- SRW Shift Right Word (16-Bit)
- SLD Shift Left Double Word (32-Bit)
- SRD Shift Right Double Word (32-Bit)

### 11.1.2 SSI Shift Sign Integer (16-Bit)

## Formate

## SSI <br> SSI <number>

| Address | Data type | Description |
| :--- | :--- | :--- |
| <number> | integer, unsigned | number of bit positions to be shifted, range <br> from 0 to 15 |

## Description

SSI (shift right with sign integer) shifts only the contents of ACCU 1- L to the right bit by bit. The bit places that are vacated by the shift instruction are filled with the signal state of the sign bit (bit 15). The bit that is shifted out last is loaded into the status word bit CC 1. The number of bit positions to be shifted is specified either by the address <number> or by a value in ACCU 2-L-L.

SSI <number>: The number of shifts is specified by the address <number>. The permissible value range is from 0 to 15 . The CC 0 and OV status word bits are reset to 0 if <number> is greater than zero. If <number> is equal to zero, the shift instruction is regarded as a NOP operation.

SSI: The number of shifts is specified by the value in ACCU 2- L- L. The possible value range is from 0 to 255 . A shift number $>16$ always produces the same result (ACCU $1=16 \# 0000, C C 1=0$, or ACCU $1=16 \# F F F F, C C 1=1$ ). If the shift number is greater than 0 , the status word bits CC 0 and $O V$ are reset to 0 . If the shift number is zero, then the shift instruction is regarded as a NOP operation.

### 11.1.3 SSD Shift Sign Double Integer (32-Bit)

## Formate

SSD
SSD <number>

| Address | Data type | Description |
| :--- | :--- | :--- |
| <number> | integer, unsigned | number of bit positions to be shifted, range <br> from 0 to 32 |

## Description

SSD (shift right with sign double integer) shifts the entire contents of ACCU 1 to the right bit by bit. The bit places that are vacated by the shift instruction are filled with the signal state of the sign bit. The bit that is shifted out last is loaded into the status word bit CC 1. The number of bit positions to be shifted is specified either by the address <number> or by a value in ACCU 2-L-L.

SSD <number>: The number of shifts is specified by the address <number>. The permissible value range is from 0 to 32. The CC 0 and OV status word bits are reset to 0 if <number> is greater than 0 . If <number> is equal to 0 , the shift instruction is regarded as a NOP operation.
SSD: The number of shifts is specified by the value in ACCU 2-L-L. The possible value range is from 0 to 255 . A shift number $>32$ always produces the same result (ACCU $1=32 \# 00000000, C C 1=0$ or ACCU $1=32 \# F F F F F F F F, C C 1=1$ ). If the shift number is greater than 0 , the status word bits CC 0 and OV are reset to 0 . If the shift number is zero, then the shift instruction is regarded as an NOP operation.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

## Example 1

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | MD4 | //Load value into ACCU 1. |
| SSD | 7 | //Shift bits in ACCU 1 seven places to the right, according to the sign. |
| T | MD8 | //Transfer result to MD8. |

## Example 2

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | +3 | //Load value +3 into ACCU 1. |
| L | MD20 | //Load contents of ACCU 1 into ACCU 2. Load value of MD20 into ACCU 1. |
| SSD |  | //Shift number is value of ACCU 2-L-L => Shift bits with sign in ACCU 1 three |
|  |  | places to the right, fill free places with state of sign bit. |
| JP | NEXT | //Jump to NEXT jump label if the bit shifted out last ( CC 1) = 1. |

### 11.1.4 SLW Shift Left Word (16-Bit)

## Formate

## SLW <br> SLW <number>

| Address | Data type | Description |
| :--- | :--- | :--- |
| <number> | integer, unsigned | number of bit positions to be shifted, range <br> from 0 to 15 |

## Description

SLW (shift left word) shifts only the contents of ACCU 1- L to the left bit by bit. The bit places that are vacated by the shift instruction are filled with zeros. The bit that is shifted out last is loaded into the status word bit CC 1. The number of bit positions to be shifted is specified either by the address <number> or by a value in ACCU 2-L-L.

SLW <number>: The number of shifts is specified by the address <number>. The permissible value range is from 0 to 15 . The status word bits CC 0 and OV are reset to zero if <number> is greater than zero. If <number> is equal to zero, then the shift instruction is regarded as a NOP operation.

SLW: The number of shifts is specified by the value in ACCU 2- L- L. The possible value range is from 0 to 255 . A shift number $>16$ always produces the same result: ACCU $1-L=0, C C 1=0, C C 0=0$, and $O V=0$. If $0<$ shift number $<=16$, the status word bits CC 0 and $O V$ are reset to 0 . If the shift number is zero, then the shift instruction is regarded as a NOP operation.

## Status word

## Example 1

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | MW4 | //Load value into ACCU 1. |
| SLW | 5 | //Shift the bits in ACCU 1 five places to the left. |
| T | MW8 | //Transfer result to MW8. |

## Example 2

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | +3 | //Load value +3 into ACCU 1. |
| L | MW20 | //Load contents of ACCU 1 into ACCU 2. Load value of MW20 into ACCU 1. |
| SLW |  | //Shift number is value of ACCU 2- L- L => Shift bits in ACCU 1-L three places |
| to the left. |  |  |
| JP | NEXT | //Jump to NEXT jump label if the bit shifted out last (CC 1$)=1$. |

### 11.1.5 SRW Shift Right Word (16-Bit)

## Formate

SRW
SRW <number>

| Address | Data type | Description |
| :--- | :--- | :--- |
| <number> | integer, unsigned | number of bit positions to be shifted, range <br> from 0 to 15 |

## Description

SRW (shift right word) shifts only the contents of ACCU 1- L to the right bit by bit. The bit places that are vacated by the shift instruction are filled with zeros. The bit that is shifted out last is loaded into the status bit CC 1. The number of bit positions to be shifted is specified either by the address <number> or by a value in ACCU 2-L-L.

SRW <number>: The number of shifts is specified by the address <number>. The permissible value range is from 0 to 15 . The status word bits CC 0 and OV are reset to 0 if <number> is greater than zero. If <number> is equal to 0 , the shift instruction is regarded as a NOP operation.

SRW: The number of shifts is specified by the value in ACCU 2- L- L. The possible value range is from 0 to 255 . A shift number $>16$ always produces the same result: ACCU $1-\mathrm{L}=0, \mathrm{CC} 1=0, C C 0=0$, and $\mathrm{OV}=0$. If $0<$ shift number $<=16$, the status word bits CC 0 and OV are reset to 0 . If the shift number is zero, then the shift instruction is regarded as a NOP operation.

## Status word

| SRD |  | //Shift number is value of ACCU 2- L-L => Shift bits in ACCU 1 three places <br> to the right. |
| JP | NEXT | //Jump to NEXT jump label if the bit shifted out last (CC 1) =1. |

### 11.2 Rotate Instructions

### 11.2.1 Overview of Rotate Instructions

## Description

You can use the Rotate instructions to rotate the entire contents of accumulator 1 bit by bit to the left or to the right (see also CPU Registers). The Rotate instructions trigger functions that are similar to the shift functions described in Section 14.1. However, the vacated bit places are filled with the signal states of the bits that are shifted out of the accumulator.

The number that follows the rotate instruction or a value in the low byte of the low word of accumulator 2 indicates the number of bits by which to rotate. Depending on the instruction, rotation takes place via the CC 1 bit of the status word. The CC 0 bit of the status word is reset to 0 .

The following Rotate instructions are available:

- RLD Rotate Left Double Word (32-Bit)
- RRD Rotate Right Double Word (32-Bit)
- RLDA Rotate ACCU 1 Left via CC 1 (32-Bit)
- RRDA Rotate ACCU 1 Right via CC 1 (32-Bit)

### 11.2.2 RLD Rotate Left Double Word (32-Bit)

## Format

## RLD <br> RLD <number>

| Address | Data type | Description |
| :--- | :--- | :--- |
| <number> | integer, unsigned | number of bit positions to be rotated, range <br> from 0 to 32 |

## Description

RLD (rotate left double word) rotates the entire contents of ACCU1 to the left bit by bit. The bit places that are vacated by the rotate instruction are filled with the signal states of the bits that are shifted out of ACCU 1. The bit that is rotated last is loaded into the status bit CC 1. The number of bit positions to be rotated is specified either by the address <number> or by a value in ACCU 2-L-L.

RLD <number>: The number of rotations is specified by the address <number>. The permissible value range is from 0 to 32 . The status word bits CC 0 and $O V$ are reset to 0 if <number> is greater than zero. If <number> is equal to 0 , the rotate instruction is regarded as a NOP operation.

RLD: The number of rotations is specified by the value in ACCU 2- L- L. The possible value range is from 0 to 255 . The status word bits CC 0 and OV are reset to 0 if the contents of ACCU 2-L-L are greater than zero. If the rotation number is zero, then the rotate instruction is regarded as an NOP operation.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | x | x | x | - | - | - | - | - |

## Examples

| Contents | ACCU1-H |  |  | ACCU1-L |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

| after execution of RLD 4 | 1111 | 0110 | 0100 | 0101 | 1101 | 0011 | 1011 | 0101 |

## Example 1

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | MD2 | //Load value into ACCU 1. |
| RLD | 4 | //Rotate bits in ACCU 1 four places to the left. |
| T | MD8 | //Transfer result to MD8. |

## Example 2

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | +3 | //Load value +3 into ACCU 1. |
| L | MD20 | //Load contents of ACCU 1 into ACCU 2. Load value of MD20 into ACCU 1. |
| RLD | //Rotation number is value of ACCU 2- L- L => Rotate bits in ACCU 1 three places <br> to the left. |  |
| JP | NEXT | //Jump to NEXT jump label if the bit rotated out last (CC 1) $=1$. |

### 11.2.3 RRD Rotate Right Double Word (32-Bit)

## Formate

```
RRD
RRD <number>
```

| Address | Data type | Description |
| :--- | :--- | :--- |
| <number> | integer, unsigned | number of bit positions to be rotated, range <br> from 0 to 32 |

## Description

RRD (rotate right double word) rotates the entire contents of ACCU 1 to the right bit by bit. The bit places that are vacated by the rotate instruction are filled with the signal states of the bits that are shifted out of ACCU 1. The bit that is rotated last is loaded into the status bit CC 1. The number of bit positions to be rotated is specified either by the address <number> or by a value in ACCU 2-L-L.

RRD <number>: The number of rotations is specified by the address <number>. The permissible value range is from 0 to 32 . The status word bits CC 0 and OV are reset to 0 if <number> is greater than zero. If <number> equals zero, then the rotate instruction is regarded as a NOP operation.

RRD: The number of rotations is specified by the value in ACCU 2- L- L. The possible value range is from 0 to 255 . The status word bits are reset to 0 if the contents of ACCU 2-L-L are greater than zero.

## Status word

## 12 Timer Instructions

### 12.1 Overview of Timer Instructions

## Description

You can find information for setting and selecting the correct time under Location of a Timer in Memory and components of a Timer.

The following timer instructions are available:

- FR Enable Timer (Free)
- L Load Current Timer Value into ACCU 1 as Integer
- LC Load Current Timer Value into ACCU 1 as BCD
- R Reset Timer
- SD On-Delay Timer
- SE Extended Pulse Timer
- SF Off-Delay Timer
- SP Pulse Timer
- SS Retentive On-Delay Timer

### 12.2 Location of a Timer in Memory and Components of a Timer

## Area in Memory

Timers have an area reserved for them in the memory of your CPU. This memory area reserves one 16-bit word for each timer address. The ladderlogic instruction set supports 256 timers. Please refer to your CPU's technical information to establish the number of timer words available.

The following functions have access to the timer memory area:

- Timer instructions
- Updating of timer words by means of clock timing. This function of your CPU in the RUN mode decrements a given time value by one unit at the interval designated by the time base until the time value is equal to zero.

## Time Value

Bits 0 through 9 of the timer word contain the time value in binary code. The time value specifies a number of units. Time updating decrements the time value by one unit at an interval designated by the time base. Decrementing continues until the time value is equal to zero. You can load a time value into the low word of accumulator 1 in binary, hexadecimal, or binary coded decimal (BCD) format.

You can pre-load a time value using either of the following formats:

- W\#16\#txyz
- Where $t=$ the time base (that is, the time interval or resolution)
- Where $x y z=$ the time value in binary coded decimal format
- S5T\#aH_bM_cS_dMS
- Where $\mathrm{H}=$ hours, $\mathrm{M}=$ minutes, $\mathrm{S}=$ seconds, and MS = milliseconds; user variables are: $a, b, c, d$
- The time base is selected automatically, and the value is rounded to the next lower number with that time base.

The maximum time value that you can enter is 9,990 seconds, or $2 \mathrm{H} \_46 \mathrm{M} \_30 \mathrm{~S}$.

## Time Base

Bits 12 and 13 of the timer word contain the time base in binary code. The time base defines the interval at which the time value is decremented by one unit. The smallest time base is 10 ms ; the largest is 10 s .

| Time Base | Binary Code for the Time Base |
| :--- | :--- |
| 10 ms | 00 |
| 100 ms | 01 |
| 1 s | 10 |
| 10 s | 11 |

Values that exceed 2h46m30s are not accepted. A value whose resolution is too high for the range limits (for example, 2 h 10 ms ) is truncated down to a valid resolution. The general format for S5TIME has limits to range and resolution as shown below:

| Resolution | Range |
| :--- | :--- |
| 0.01 second | 10MS to $9 \mathrm{~S} \_990 \mathrm{MS}$ |
| 0.1 second | 100 MS to $1 \mathrm{M} \_39 \mathrm{~S}$ _900MS |
| 1 second | 1S to 16 M _39S |
| 10 seconds | 10S to $2 \mathrm{H} \_46 \mathrm{M} \_30 \mathrm{~S}$ |

## Bit Configuration in ACCU 1

When a timer is started, the contents of ACCU1 are used as the time value. Bits 0 through 11 of the ACCU1-L hold the time value in binary coded decimal format (BCD format: each set of four bits contains the binary code for one decimal value). Bits 12 and 13 hold the time base in binary code.

The following figure shows the contents of ACCU1-L loaded with timer value 127 and a time base of 1 second:

## Choosing the right Timer

This overview is intended to help you choose the right timer for your timing job.

| Timer | Description |
| :--- | :--- |
| S_PULSE <br> Pulse timer | The maximum time that the output signal remains at 1 is the same as the <br> programmed time value $t$. The output signal stays at 1 for a shorter period if <br> the input signal changes to 0. |
| S_PEXT <br> Extended pulse timer | The output signal remains at 1 for the programmed length of time, regardless <br> of how long the input signal stays at 1. |
| S_ODT <br> On-delay timer | The output signal changes to 1 only when the programmed time has elapsed <br> and the input signal is still 1. |
| S_ODTS <br> Retentive on-delay timer | The output signal changes from 0 to 1 only when the programmed time has <br> elapsed, regardless of how long the input signal stays at 1. |
| S_OFFDT <br> Off-delay timer | The output signal changes to 1 when the input signal changes to 1 or while <br> the timer is running. The time is started when the input signal changes from 1 <br> to 0. |

### 12.3 FR Enable Timer (Free)

## Format

## FR <timer>

| Address | Data type | Memory area | Description |
| :--- | :--- | :--- | :--- |
| <timer> | TIMER | T | Timer number, range depends on <br> CPU |

## Description of instruction

When the RLO transitions from "0" to "1", FR <timer> clears the edge-detecting flag that is used for starting the addressed timer. A change in the RLO bit from 0 to 1 in front of an enable instruction (FR) enables a timer.

Timer enable is not required to start a timer, nor is it required for normal timer instruction. An enable is used only to re-trigger a running timer, that is, to restart a timer. The restarting is possible only when the start instruction continues to be processed with RLO $=1$.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | - | - | 0 |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| A | I 2.0 |  |
| FR | T1 | //Enable timer T1. |
| A | I 2.1 |  |
| L | S5T\#10s | //Preset 10 seconds into ACCU 1. |
| SI | T1 | //Start timer T1 as a pulse timer. |
| A | I 2.2 |  |
| R | T1 | //Reset timer T1. |
| A | T1 | //Check signal state of timer T1. |
| $=$ | Q 4.0 |  |
| L | T1 | //Load current time value of timer T1 as a binary number. |
| T MW10 |  |  |

t = programmed time interval
(1) A change in the RLO from 0 to 1 at the enable input while the timer is running completely restarts the timer. The programmed time is used as the current time for the restart. A change in the RLO from 1 to 0 at the enable input has no effect.
(2) If the RLO changes from 0 to 1 at the enable input while the timer is not running and there is still an RLO of 1 at the start input, the timer will also be started as a pulse with the time programmed.
(3) A change in the RLO from 0 to 1 at the enable input while there is still an RLO of at the start input has no effect on the timer.

### 12.4 L Load Current Timer Value into ACCU 1 as Integer

## Format

L <timer>

| Address | Data type | Memory area | Description |
| :--- | :--- | :--- | :--- |
| <timer> | TIMER | T | Timer number, range depends on <br> CPU |

## Description of instruction

L <timer> loads the current timer value from the addressed timer word without a time base as a binary integer into ACCU 1-L after the contents of ACCU 1 have been saved into ACCU 2.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

$\qquad$

## Note

L <timer> loads only the binary code of the current timer value into ACCU1-L, and not the time base. The time loaded is the initial value minus the time elapsed since the timer was started.

### 12.5 LC Load Current Timer Value into ACCU 1 as BCD

## Format

## LC <timer>

| Address | Data type | Memory area | Description |
| :--- | :--- | :--- | :--- |
| <timer> | TIMER | T | Timer number, range depends on <br> CPU |

## Description of instruction

LC <timer> loads the current timer value and time base from the addressed timer word as a Binary Coded Decimal (BCD) number into ACCU 1 after the content of ACCU 1 has been saved into ACCU 2.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| LC | T1 | //Load ACCU 1-L with the time base and current timer value of timer T1 in binary <br> coded decimal (BCD) format. |

### 12.6 R Reset Timer

## Format

R <timer>

| Address | Data type | Memory area | Description |
| :--- | :--- | :--- | :--- |
| <timer> | TIMER | T | Timer number, range depends on <br> CPU |

## Description of instruction

$\mathbf{R}$ <timer> stops the current timing function and clears the timer value and the time base of the addressed timer word if the RLO transitions from 0 to 1 .

## Status word

|  | BIE | A1 | A0 | OV | OS | OR | STA | VKE | IER |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | - | - | 0 |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| A | I 2.1 | //Check the signal state of input I 2.1 If RLO transitioned from $0=1$, |
| R | T1 |  |

### 12.7 SP Pulse Timer

## Format

## SP <timer>

| Address | Data type | Memory area | Description |
| :--- | :--- | :--- | :--- |
| <timer> | TIMER | T | Timer number, range depends on <br> CPU |

## Description of instruction

SP <timer> starts the addressed timer when the RLO transitions from "0" to "1". The programmed time elapses as long as RLO =1. The timer is stopped if RLO transitions to "0" before the programmed time interval has expired. This timer start command expects the time value and the time base to be stored as a BCD number in ACCU 1-L.

See also Location of a Timer in Memory and Components of a Timer.

## Status word

|  | BIE | A1 | A0 | OV | OS | OR | STA | VKE | IER |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | - | - | 0 |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| A | I 2.0 |  |
| FR | T1 | //Enable timer T1. |
| A | I 2.1 |  |
| L | S5T\#10s | //Preset 10 seconds into ACCU 1. |
| SP | T1 | //Start timer T1 as a pulse timer. |
| A | I 2.2 |  |
| R | T1 | //Reset timer T1. |
| A | T1 | //Check signal state of timer T1. |
| = | Q 4.0 |  |
| L | T1 | //Load current time value of timer T1 as binary. |
| T | MW10 |  |
| LC | T1 | //Load current time value of timer T1 as BCD. |
| T | MW12 |  |

| Enable input | 12.0 | 12.1 |  |
| :--- | :--- | :--- | :--- |
| Start input |  |  |  |

### 12.8 SE Extended Pulse Timer

## Format

## SE <timer>

| Address | Data type | Memory area | Description |
| :--- | :--- | :--- | :--- |
| <timer> | TIMER | T | Timer number, range depends on <br> CPU |

## Description of instruction

SE <timer> starts the addressed timer when the RLO transitions from "0" to "1". The programmed time interval elapses, even if the RLO transitions to "0" in the meantime. The programmed time interval is started again if RLO transitions from "0" to "1" before the programmed time has expired. This timer start command expects the time value and the time base to be stored as a BCD number in ACCU 1-L.

See also Location of a Timer in Memory and Components of a Timer.

## Status word

|  | BIE | A1 | A0 | OV | OS | OR | STA | VKE | IER |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | - | - | 0 |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| A | I 2.0 |  |
| FR | T1 | //Enable timer T1. |
| A | I 2.1 |  |
| L | S5T\#10s | //Preset 10 seconds into ACCU 1. |
| SE | T1 | //Start timer T1 as an extended pulse timer. |
| A | I 2.2 |  |
| R | T1 | //Reset timer T1. |
| A | T1 | //Check signal state of timer T1. |
| $=$ | Q 4.0 |  |
| L | T1 | //Load current timer value of timer T1 as binary. |
| T | MW10 |  |
| LC | T1 | //Load current timer value of timer T1 as BCD. |
| T | MW12 |  |

### 12.9 SD On-Delay Timer

## Format

## SD <timer>

| Address | Data type | Memory area | Description |
| :--- | :--- | :--- | :--- |
| <timer> | TIMER | T | Timer number, range depends on <br> CPU |

## Description of instruction

SD <timer> starts the addressed timer when the RLO transitions from "0" to "1". The programmed time interval elapses as long as RLO =1. The time is stopped if RLO transitions to " 0 " before the programmed time interval has expired. This timer start instruction expects the time value and the time base to be stored as a BCD number in ACCU 1-L.

See also Location of a Timer in Memory and Components of a Timer

## Status word

|  | BIE | A1 | A0 | OV | OS | OR | STA | VKE | IER |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | - | - | 0 |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| A | I 2.0 |  |
| FR | T1 | //Enable timer T1. |
| A | I 2.1 |  |
| L | S5T\#10s | //Preset 10 seconds into ACCU 1. |
| SD | T1 | //Start timer T1 as an on-delay timer. |
| A | I 2.2 |  |
| R | T1 | //Reset timer T1. |
| A | T1 | //Check signal state of timer T1. |
| $=$ | Q 4.0 |  |
| L | T1 | //Load current timer value of timer T1 as binary. |
| T | MW10 |  |
| LC | T1 | //Load current timer value of timer T1 as BCD. |
| T | MW12 |  |

### 12.10 SS Retentive On-Delay Timer

## Format

## SS <timer>

| Address | Data type | Memory area | Description |
| :--- | :--- | :--- | :--- |
| <timer> | TIMER | T | Timer number, range depends on <br> CPU |

## Description of instruction

SS <timer> (start timer as a retentive ON timer) starts the addressed timer when the RLO transitions from " 0 " to "1". The full programmed time interval elapses, even if the RLO transitions to " 0 " in the meantime. The programmed time interval is re-triggered (started again) if RLO transitions from "0" to "1" before the programmed time has expired. This timer start command expects the time value and the time base to be stored as a BCD number in ACCU 1-L.
See also Location of a Timer in Memory and Components of a Timer.

## Status word

|  | BIE | A1 | A0 | OV | OS | OR | STA | VKE | IER |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | 0 | - | - | 0 |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| A | I 2.0 |  |
| FR | T1 | //Enable timer T1. |
| A | I 2.1 |  |
| L | S5T\#10s | //Preset 10 seconds into ACCU 1. |
| SS | T1 | //Start timer T1 as a retentive on-delay timer. |
| A | I 2.2 |  |
| R | T1 | //Reset timer T1. |
| A | T1 | //Check signal state of timer T1. |
| $=$ | Q 4.0 |  |
| L | T1 | //Load current time value of timer T1 as binary. |
| T | MW10 |  |
| LC | T1 | //Load current time value of timer T1 as BCD. |
| T | MW12 |  |

Enable input $\quad 12.0$

### 12.11 SF Off-Delay Timer

## Format

SF <timer>

| Address | Data type | Memory area | Description |
| :--- | :--- | :--- | :--- |
| <timer> | TIMER | T | Timer number, range depends on <br> CPU |

## Description of instruction

SF <timer> starts the addressed timer when the RLO transitions from "1" to "0". The programmed time elapses as long as RLO $=0$. The time is stopped if RLO transitions to "1" before the programmed time interval has expired. This timer start command expects the time value and the time base to be stored as a BCD number in ACCU 1-L.

## 13 Word Logic Instructions

### 13.1 Overview of Word Logic Instructions

## Description

Word logic instructions compare pairs of words (16 bits) and double words (32 bits) bit by bit, according to Boolean logic. Each word or double word must be in one of the two accumulators.

For words, the contents of the low word of accumulator 2 is combined with the contents of the low word of accumulator 1. The result of the combination is stored in the low word of accumulator 1, overwriting the old contents.

For double words, the contents of accumulator 2 is combined with the contents of accumulator 1. The result of the combination is stored in accumulator 1, overwriting the old contents.

If the result does not equal 0 , bit CC 1 of the status word is set to " 1 ". If the result does equal 0 , bit CC 1 of the status word is set to " 0 ".

The following instructions are available for performing Word Logic operations:

- AW AND Word (16-Bit)
- OW OR Word (16-Bit)
- XOW Exclusive OR Word (16-Bit)
- AD AND Double Word (32-Bit)
- OD OR Double Word (32-Bit)
- XOD Exclusive OR Double Word (32-Bit)

### 13.2 AW AND Word (16-Bit)

## Format

## AW <br> AW <constant>

| Address | Data type | Description |
| :--- | :--- | :--- |
| <constant> | WORD, | Bit pattern to be combined with ACCU 1-L by |
|  | 16-bit constant | AND |

## Description of instruction

AW (AND word) combines the contents of ACCU 1-L with ACCU 2-L or a 16 bit-constant bit by bit according to the Boolean logic operation AND. A bit in the result word is "1" only when the corresponding bits of both words combined in the logic operation are "1". The result is stored in ACCU 1-L. ACCU 1-H and ACCU 2 (and ACCU 3 and ACCU 4 for CPUs with four ACCUs) remain unchanged. The status bit CC 1 is set as a result of the operation (CC $1=1$ if result is unequal to zero). The status word bits CC 0 and OV are reset to 0 .

AW: Combines ACCU 1-L with ACCU 2-L.
AW <constant>: Combines ACCU 1 with a 16-bit constant.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | x | 0 | 0 | - | - | - | - | - |

## Examples

| Bit | $\mathbf{1 5} \ldots$ | $\ldots$ | $\ldots$ | $\ldots .0$ |
| :--- | :--- | :--- | :--- | :--- |
| ACCU 1-L before execution of AW | 0101 | 1001 | 0011 | 1011 |
| ACCU 2-L or 16-bit constant: | 1111 | 0110 | 1011 | 0101 |
| Result (ACCU 1-L) after execution of AW | 0101 | 0000 | 0011 | 0001 |

## Example 1

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | IW20 | //Load contents of IW20 into ACCU 1-L. |
| L | IW22 | //Load contents of ACCU 1 into ACCU 2. Load contents of IW22 into ACCU 1-L. |
| AW |  | //Combine bits from ACCU 1-L with ACCU 2-L bits by AND; store result in ACCU |
| T | MW 8 | 1-L. |

## Example 2

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | IW20 | //Load contents of IW20 into ACCU 1-L. |
| AW | W\#16\#0FFF | //Combine bits of ACCU 1-L with bit pattern of 16-bit constant |
|  |  | (0000_1111_1111_1111) by AND; store result in ACCU 1-L. |
| JP | NEXT | //Jump to NEXT jump label if result is unequal to zero, (CC $1=1$ ). |

### 13.3 OW OR Word (16-Bit)

## Format

## OW <br> OW <constant>

| Address | Data type | Description |
| :--- | :--- | :--- |
| <constant> | WORD, | Bit pattern to be combined with ACCU 1-L by |
|  | 16-bit constant | OR |

## Description of instruction

OW (OR word) combines the contents of ACCU 1-L with ACCU 2-L or a 16 bit-constant bit by bit according to the Boolean logic operation OR. A bit in the result word is "1" when at least one of the corresponding bits of both words combined in the logic operation is " 1 ". The result is stored in ACCU 1-L. ACCU 1-H and ACCU 2 (and ACCU 3 and ACCU 4 for CPUs with four ACCUs) remain unchanged. The instruction is executed without regard to, and without affecting, the RLO. The status bit CC 1 is set as a result of the operation (CC $1=1$ if result is unequal to zero). The status word bits CC 0 and OV are reset to 0 .

OW: Combines ACCU 1-L with ACCU 2-L.
OW <constant>: Combines ACCU 1-L with a 16-bit constant.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | x | 0 | 0 | - | - | - | - | - |

## Examples

| Bit | $\mathbf{1 5} \ldots$ | $\ldots$ | $\ldots$ | $\ldots .0$ |
| :--- | :--- | :--- | :--- | :--- |
| ACCU 1-L before execution of OW | 0101 | 0101 | 0011 | 1011 |
| ACCU 2-L or 16 bit constant: | 1111 | 0110 | 1011 | 0101 |
| Result (ACCU 1-L) after execution of OW | 1111 | 0111 | 1011 | 1111 |

## Example 1

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | IW20 | //Laad contents of IW20 into ACCU 1-L. |
| L | IW22 | 1/Load contents of ACCU 1 into ACCU 2. Load contents of IW22 into ACCU |
| OW |  | 1-L. |
|  | 1/Combine bits from ACCU 1-L with ACCU 2-L by OR, store result in ACCU |  |
| T | MW8 | 1-L. |

## Example 2

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | IW20 | //Load contents of IW 20 into ACCU 1-L. |
| OW | W\#16\#0FFF | //Combine bits of ACCU 1-L with bit pattern of 16-bit constant |
|  |  | (0000_1111_1111_1111) by OR; store result in ACCU 1-L. |
| JP | NEXT | //Jump to NEXT jump label if result is unequal to zero (CC $1=1$ ). |

### 13.4 XOW Exclusive OR Word (16-Bit)

## Format

```
xOW
XOW <constant>
```

| Address | Data type | Description |
| :--- | :--- | :--- |
| <constant> | WORD, | Bit pattern to be combined with ACCU 1-L by <br> XOR (Exclusive Or) |

## Description of instruction

XOW (XOR word) combines the contents of ACCU 1-L with ACCU 2-L or a 16 bit-constant bit by bit according to the Boolean logic operation XOR. A bit in the result word is "1" only when one of the corresponding bits of both words combined in the logic operation is "1". The result is stored in ACCU 1-L. ACCU 1-H and ACCU 2 remain unchanged. The status bit CC 1 is set as a result of the operation (CC $1=1$ if result is unequal to zero). The status word bits CC 0 and OV are reset to 0 .

You can use the Exclusive OR function several times. The result of logic operation is then "1" if an impair number of checked addresses ist "1".

XOW: Combines ACCU 1-L with ACCU 2-L.
XOW <constant>: Combines ACCU 1-L with a 16-bit constant.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | x | 0 | 0 | - | - | - | - | - |

## Examples

| Bit | $\mathbf{1 5} \ldots$ | $\ldots$ | $\ldots$ | $\ldots .0$ |
| :--- | :--- | :--- | :--- | :--- |
| ACCU 1 before execution of XOW | 0101 | 0101 | 0011 | 1011 |
| ACCU 2-L or 16-bit constant: | 1111 | 0110 | 1011 | 0101 |
| Result (ACCU 1) after execution of XOW | 1010 | 0011 | 1000 | 1110 |

## Example 1

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | IW20 | //Load contents of IW20 into ACCU 1-L. |
| L | IW22 | //Load contents of ACCU 1 into ACCU 2. Load contents of ID24 into ACCU 1-L. |
| XOW |  | //Combine bits of ACCU 1-L with ACCU 2-L bits by XOR, store result in ACCU |
| T | MW8 | 1-LTransfer result to MW8. |

## Example 2

| STL |  | Explanation |
| :---: | :---: | :---: |
| L | IW20 | //Load contents of IW20 into ACCU 1-L. |
| xow | 16\#0FFF | //Combine bits of ACCU 1-L with bit pattern of 16-bit constant (0000_1111_1111_1111) by XOR, store result in ACCU 1-L. |
| JP | next | //Jump to NEXT jump label if result is unequal to zero, (CC $1=1$ ). |

### 13.5 AD AND Double Word (32-Bit)

## Format

## AD AD <constant>

| Address | Data type | Description |
| :--- | :--- | :--- |
| <constant> | DWORD, | Bit pattern to be combined with ACCU 1 by |
|  | 32-bit constant | AND |

## Description of instruction

AD (AND double word) combines the contents of ACCU 1 with ACCU 2 or a 32-bit constant bit by bit according to the Boolean logic operation AND. A bit in the result double word is "1" only when the corresponding bits of both double words combined in the logic operation are " 1 ". The result is stored in ACCU 1. ACCU 2 (and ACCU 3 and ACCU 4 for CPU's with four ACCUs) remains unchanged. The status bit CC 1 is set as a result of the operation (CC $1=1$ if result is unequal to zero). The status word bits CC 0 and $O V$ are reset to 0 .

AD: Combines ACCU 1 with ACCU 2.
AD <constant>: Combines ACCU 1 with a 32-bit constant.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | $x$ | 0 | 0 | - | - | - | - | - |

## Examples

| Bit | $\mathbf{3 1 . .}$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots .0$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| ACCU 1 before execution of UD | 0101 | 0000 | 1111 | 1100 | 1000 | 1001 | 0011 | 1011 |
| ACCU 2 or 32-bit constante | 1111 | 0011 | 1000 | 0101 | 0111 | 0110 | 1011 | 0101 |
| Result (ACCU 1) after execution of UD | 0101 | 0000 | 1000 | 0100 | 0000 | 0000 | 0011 | 0001 |

## Example 1

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | ID20 | //Load contents of ID20 into ACCU 1. |
| L | ID24 | //Load contents of ACCU 1 into ACCU 2 . Load contents of ID24 into ACCU |
| AD |  | 1. |
|  | //Combine bits from ACCU 1 with ACCU 2 by AND, store result in ACCU |  |
| T | MD8 | 1. |

## Example 2

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | ID 20 | //Load contents of ID20 into ACCU 1. |
| AD | DW\#16\#0FFF_EF21 | //Combine bits of ACCU 1 with bit pattern of 32-bit constant |
|  |  | (0000_1111_1111_1111_1110_1111_0010_0001) by AND; store result in |
|  |  |  |
| JP | ACCU 1. |  |

### 13.6 OD OR Double Word (32-Bit)

## Format

## OD <br> OD <constant>

| Address | Data type | Description |
| :--- | :--- | :--- |
| <constant> | DWORD, | Bit pattern to be combined with ACCU 1 by |
|  | 32-bit constant | OR |

## Description of instruction

OD (OR double word) combines the contents of ACCU 1 with ACCU 2 or a 32-bit constant bit by bit according to the Boolean logic operation OR. A bit in the result double word is " 1 " when at least one of the corresponding bits of both double words combined in the logic operation is "1". The result is stored in ACCU 1. ACCU 2 (and ACCU 3 and ACCU 4 for CPUs with four ACCUs) remains unchanged. The status bit CC 1 is set as a function of the result of the operation (CC $1=1$ if result is unequal to zero). The status word bits CC 0 and OV are reset to 0 .

OD: Combines ACCU 1 with ACCU 2.
OD <constant>: Combines ACCU 1 with a 32-bit constant.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | $x$ | 0 | 0 | - | - | - | - | - |

## Examples

| Bit | $31 .$. | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots .0$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| ACCU 1 before execution of OD | 0101 | 0000 | 1111 | 1100 | 1000 | 0101 | 0011 | 1011 |
| ACCU 2 or 32-bit constant: | 1111 | 0011 | 1000 | 0101 | 0111 | 0110 | 1011 | 0101 |
| Result (ACCU 1) after execution of OD | 1111 | 0011 | 1111 | 1101 | 1111 | 0111 | 1011 | 1111 |

## Example 1

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | ID20 | //Load contents of ID20 into ACCU 1. |
| L | ID24 | //Load contents of ACCU 1 into ACCU 2. Load contents of ID24 into |
| OD |  | ACCU 1. |
|  | //Combine bits from ACCU 1 with ACCU 2 bits by OR; store result in |  |
| T | MD8 | ACCU 1. |

## Example 2

| STL |  | Explanation |
| :---: | :---: | :---: |
| L | ID20 | //Load contents of ID20 into ACCU 1. |
| OD | DW\#16\#0FFF_EF21 | //Combine bits of ACCU 1 with bit pattern of 32 -bit constant (0000_1111_1111_1111_1110_1111_0010_0001) by OR, store result in ACCU 1. |
| JP | NEXT | //Jump to NEXT jump label if result is not equal to zero, (CC $1=$ 1). |

### 13.7 XOD Exclusive OR Double Word (32-Bit)

## Format

```
XOD
XOD <constant>
```

| Address | Data type | Description |
| :--- | :--- | :--- |
| <constant> | DWORD, | Bit pattern to be combined with ACCU 1 by <br> XOR (Exclusive Or). |

## Description of instruction

XOD (XOR double word) combines the contents of ACCU 1 with ACCU 2 or a 32-bit constant bit by bit according to the Boolean logic operation XOR (Exclusive Or). A bit in the result double word is "1" when only one of the corresponding bits of both double words combined in the logic operation is "1". The result is stored in ACCU 1. ACCU 2 remains unchanged. The status bit CC 1 is set as a result of the operation (CC 1 = 1 if result is not equal to zero). The status word bits CC 0 and OV are reset to 0.

You can use the Exclusive OR function several times. The result of logic operation is then "1" if an impair number of checked addresses ist "1".

XOD: Combines ACCU 1 with ACCU 2.
XOD <constant>: Combines ACCU 1 with a 32-bit constant.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | x | 0 | 0 | - | - | - | - | - |

## Examples

| Bit | $31 \ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots .0$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| ACCU 1 before execution of XOD | 0101 | 0000 | 1111 | 1100 | 1000 | 0101 | 0011 | 1011 |
| ACCU 2 or 32-bit constant | 1111 | 0011 | 1000 | 0101 | 0111 | 0110 | 1011 | 0101 |
| Result (ACCU 1) after execution of XOD | 1010 | 0011 | 0111 | 1001 | 1111 | 0011 | 1000 | 1110 |

## Example 1

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | ID20 | //Lad contents of ID20 into ACCU 1. |
| L | ID24 | //Load contents of ACCU 1 into ACCU 2. Load contents of ID24 into |
| XOD |  | ACCU 1. |
|  |  | //Combine bits from ACCU 1 with ACCU 2 by XOR; store result in ACCU |
| T | MD8 | 1. |

## Example 2

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | ID20 | //Load contents of ID20 into ACCU 1. |
| XOD | DW\#16\#0FFF_EF21 | //Combine bits from ACCU 1 with bit pattern of 32 -bit constant |
|  |  | $\left(0000 \_1111 \_1111 \_1111 \_1111 \_1110 \_0010 \_0001\right)$ by XOR, store result in |
|  |  |  |
| JP | ACCU 1. |  |

## 14 Accumulator Instructions

### 14.1 Overview of Accumulator and Address Register Instructions

## Description

The following instructions are available to you for handling the contents of one or both accumulators:

- TAK Toggle ACCU 1 with ACCU 2
- PUSH CPU with Two ACCUs
- PUSH CPU with Four ACCUs
- POP CPU with Two ACCUs
- POP CPU with Four ACCUs
- ENT Enter ACCU Stack
- LEAVE Leave ACCU Stack
- INC Increment ACCU 1-L-L
- DEC Decrement ACCU 1-L-L
- +AR1 Add ACCU 1 to Address Register 1
- +AR2 Add ACCU 1 to Address Register 2
- BLD Program Display Instruction (Null)
- NOP 0 Null Instruction
- NOP 1 Null Instruction

### 14.2 TAK Toggle ACCU 1 with ACCU 2

## Format

TAK

## Description

TAK (toggle ACCU 1 with ACCU 2) exchanges the contents of ACCU 1 with the contents of ACCU 2. The instruction is executed without regard to, and without affecting, the status bits. The contents of ACCU 3 and ACCU 4 remain unchanged for CPUs with four ACCU s.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example: Subtract smaller value from greater value

| STL |  |  | Explanation |
| :---: | :---: | :---: | :---: |
| NEXT : | L | MW10 | //Load contents of MW10 into ACCU 1-L. |
|  | L | MW12 | //Load contents of ACCU 1-L into ACCU 2-L. Load contents of MW12 into ACCU 1-L. |
|  | >I |  | //Check if ACCU 2-L (MW10) greater than ACCU 1-L (MW12). |
|  | SPB | NEXT | //Jump to NEXT jump label if ACCU 2 (MW10) is greater than ACCU 1 (MW12). |
|  | TAK |  | //Swap contents ACCU 1 and ACCU 2 |
|  | -I |  | //Subtract contents of ACCU 2-L from contents of ACCU 1-L. |
|  | T | MW14 | //Transfer result (= greater value minus smaller value) to MW14. |

| Contents | ACCU 1 | ACCU 2 |
| :--- | :--- | :--- |
| before executing TAK instruction | <MW12> | $<$ MW10 $>$ |
| after executing TAK instruction | <MW10 $>$ | $<$ MW12> |

### 14.3 POP CPU with Two ACCUs

## Format

```
POP
```

## Description

POP (CPU with two ACCUs) copies the entire contents of ACCU 2 to ACCU 1. ACCU 2 remains unchanged. The instruction is executed without regard to, and without affecting, the status bits.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| T | MD10 | //Transfer contents of ACCU 1 (= value A) to MD10 |
| POP |  | //Copy entire contents of ACCU 2 to ACCU 1 |
| T | MD14 | //Transfer contents of ACCU 1 (= value B) to MD14 |

| Contents | ACCU 1 | ACCU 2 |
| :--- | :--- | :--- |
| before executing POP instruction | value A | value B |
| after executing POP instruction | value B | value B |

### 14.4 POP CPU with Four ACCUs

## Format

```
POP
```

## Description

POP (CPU with four ACCUs) copies the entire contents of ACCU 2 to ACCU 1, the contents of ACCU 3 to ACCU 2, and the contents of ACCU 4 to ACCU 3. ACCU 4 remains unchanged. The instruction is executed without regard to, and without affecting, the status bits.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| $\mathbf{T}$ | MD10 | //Transfer contents of ACCU 1 ( $=$ value A) to MD10 |
| POP |  | //Copy entire contents of ACCU 2 to ACCU 1 |
| T | MD14 | //Transfer contents of ACCU 1 (= value B) to MD14 |

| Contents | ACCU 1 | ACCU 2 | ACCU 3 | ACCU 4 |
| :--- | :--- | :--- | :--- | :--- |
| before executing POP instruction | value A | value B | value C | value D |
| after executing POP instruction | value B | value C | value D | value D |

### 14.5 PUSH CPU with Two ACCUs

## Format

```
PUSH
```

## Description

PUSH (ACCU 1 to ACCU 2) copies the entire contents of ACCU 1 to ACCU 2. ACCU 1 remains unchanged. The instruction is executed without regard to, and without affecting, the status bits.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

| STL |  | Explanation |
| :--- | :--- | :--- |
| L | MW10 | //Load the contents of MW10 into ACCU 1. |
| PUSH |  | //Copy entire contents of ACCU 1 into ACCU 2. |

| Contents | ACCU 1 | ACCU 2 |
| :--- | :--- | :--- |
| before executing PUSH instruction | <MW10> | $<X>$ |
| after executing PUSH instruction | <MW10> | $<$ MW10> |

### 14.6 PUSH CPU with Four ACCUs

## Format

```
PUSH
```

## Description

PUSH (CPU with four ACCUs) copies the contents of ACCU 3 to ACCU 4, the contents of ACCU 2 to ACCU 3, and the contents of ACCU 1 to ACCU 2. ACCU 1 remains unchanged. The instruction is executed without regard to, and without affecting, the status bits.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | MW10 | //Load the contents of MW10 into ACCU 1. |
| PUSH |  | //Copy the entire contents of ACCU 1 to ACCU 2, the contents of ACCU 2 to ACCU |
|  |  | 3, and the contents of ACCU 3 to ACCU 4. |

| Contents | ACCU 1 | ACCU 2 | ACCU 3 | ACCU 4 |
| :--- | :--- | :--- | :--- | :--- |
| before executing PUSH instruction | value A | value B | value C | value D |
| after executing PUSH instruction | value A | value A | value B | value C |

### 14.7 ENT Enter ACCU Stack

## Format

## ENT

## Description

ENT (enter accumulator stack) copies the contents of ACCU 3 into ACCU 4 and the contents of ACCU 2 into ACCU 3. If you program the ENT instruction directly in front of a load instruction, you can save an intermediate result in ACCU 3.

## Example

| STL |  |  |
| :---: | :---: | :---: |
| L | DBD0 | //Load the value from data double word DBD0 into ACCU 1. (This value must be in the floating point format). |
| L | DBD4 | //Copy the value from ACCU 1 into ACCU 2. Load the value from data double word DBD4 into ACCU 1. (This value must be in the floating point format). |
| +R |  | //Add the contents of ACCU 1 and ACCU 2 as floating point numbers (32 bit, IEEE-FP) and save the result in ACCU 1. |
| L | DBD8 | //Copy the value from ACCU 1 into ACCU 2 load the value from data double word DBD8 into ACCU 1. |
| ENT |  | //Copy the contents of ACCU 3 into ACCU 4. Copy the contents of ACCU 2 (intermediate result) into ACCU 3. |
| L | DBD12 | //Load the value from data double word DBD12 into ACCU 1. |
| -R |  | //Subtract the contents of ACCU 1 from the contents of ACCU 2 and store the result in ACCU 1. Copy the contents of ACCU 3 into ACCU 2. Copy the contents of ACCU 4 into ACCU 3. |
| /R |  | //Divide the contents of ACCU 2 (DBD0 + DBD4) by the contents of ACCU 1 (DBD8 <br> - DBD12). Save the result in ACCU 1. |
| T | D1 | //Transfer the results (ACCU 1) to data double word DBD16. |

### 14.8 LEAVE Leave ACCU Stack

## Format

## LEAVE

## Description

LEAVE (leave accumulator stack) copies the contents of ACCU 3 into ACCU 2 and the contents of ACCU 4 into ACCU 3. If you program the LEAVE instruction directly in front of a shift or rotate instruction, and combine the accumulators, then the leave instruction functions like an arithmetic instruction. The contents of ACCU 1 and ACCU 4 remain unchanged.

### 14.9 INC Increment ACCU 1-L-L

## Format

INC <8-bit integer>

| Parameter | Data Type | Description |
| :--- | :--- | :--- |
| <8-bit integer> | 8-bit integer <br> constant | Constant added to ACCU 1-L-L; range from 0 to <br> 255 |

## Description

INC <8-bit integer> (increment ACCU 1-L-L) adds the 8-bit integer to the contents of ACCU 1-L-L and stores the result in ACCU 1-L-L. ACCU 1-L-H, ACCU 1-H, and ACCU 2 remain unchanged. The instruction is executed without regard to, and without affecting, the status bits.

## Note

These instructions are not suitable for 16 -bit or 32 -bit math because no carry is made from the low byte of the low word of accumulator 1 to the high byte of the low word of accumulator 1. For 16-bit or 32-bit math, use the +l or +D . instruction, respectively.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

| STL | Explanation |  |  |
| :--- | :--- | :--- | :--- | :--- |
| L | MB22 | //Load the value of MB22 |  |
| INC | 1 | 1/Instruction "Increment ACCU 1 | (MB22) by 1 "; store result in ACCU 1-L-L |
| T | MB22 | //Transfer the contents of ACCU | 1-L-L (result) back to MB22 |

### 14.10 DEC Decrement ACCU 1-L-L

## Format

DEC <8-bit integer>

| Address | Data Type | Description |
| :--- | :--- | :--- |
| $<8$-bit integer> | 8-bit integer <br> constant | Constant subtracted from ACCU 1-L-L; range <br> from 0 to 255 |

## Description

DEC <8-bit integer> (decrement ACCU 1-L-L) subtracts the 8-bit integer from the contents of ACCU 1-L-L and stores the result in ACCU 1-L-L. ACCU 1-L-H, ACCU $1-H$, and $A C C U 2$ remain unchanged. The instruction is executed without regard to, and without affecting, the status bits.

## Note

These instructions are not suitable for 16 -bit or 32 -bit math because no carry is made from the low byte of the low word of accumulator 1 to the high byte of the low word of accumulator 1. For 16 -bit or 32 -bit math, use the +1 or + D. instruction, respectively.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | MB250 | //Load the value of MB250 |
| DEC | 1 | //Instruction "Decrement ACCU 1-L-L by 1"; store result in ACCU 1-L-L. |
| T | MB250 | //Transfer the contents of ACCU 1-L-L (result) back to MB250. |

### 14.11 +AR1 Add ACCU 1 to Address Register 1

## Format

```
+AR1
+AR1 <P#Byte.Bit>
```

| Parameter | Data Type | Description |
| :--- | :--- | :--- |
| <P\#Byte.Bitr> | Pointer constant | Address added to AR1 |

## Description

+AR1 (add to AR1) adds an offset specified either in the statement or in ACCU 1-L to the contents of AR1. The integer (16 bit) is initially expanded to 24 bits with its correct sign and then added to the least significant 24 bits of AR1 (part of the relative address in AR1). The part of the area ID in AR1 (bits 24, 25, and 26) remains unchanged. The instruction is executed without regard to, and without affecting, the status bits.
+AR1: The integer (16 bit) to be added to the contents of AR1 is specified by the value in ACCU 1-L. Values from -32768 to +32767 are permissible.
+AR1 <P\#Byte.Bit>: The offset to be added is specified by the <P\#Byte.Bit> address.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example 1

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | +300 | //Load the value into ACCU 1-L |
| +AR1 | //Add ACCU 1-L (integer, 16 bit) to AR1. |  |

## Example 2

| STL | Explanation |
| :--- | :--- |
| +AR1 | P\#300.0 |
| //Add the offset 300.0 to AR1. |  |

### 14.12 +AR2 Add ACCU 1 to Address Register 2

## Format

```
+AR2
+AR2 <P#Byte.Bit>
```

| Parameter | Data Type | Description |
| :--- | :--- | :--- |
| <P\#Byte.Bitr> | Pointer constant | Address added to AR2 |

## Description

+AR2 (add to AR2) adds an offset specified either in the instructionor in ACCU 1-L to the contents of AR. The integer (16 bit) is initially expanded to 2 bits with its correct sign and then added to the least significant 24 bits of AR2 (part of the relative address in AR2). The part of the area ID in AR2 (bits 24, 25, and 26) remains unchanged. The instruction is executed without regard to, and without affecting, the status bits.
+AR2: The integer (16 bit) to be added to the contents of AR2 is specified by the value in ACCU 1-L. Values from -32768 to +32767 are permissible.
+AR2 <P\#Byte.Bit>: The offset to be added is specified by the <P\#Byte.Bit> address.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| writes: | - | - | - | - | - | - | - | - | - |

## Example 1

| STL | Explanation |  |
| :--- | :--- | :--- |
| L | +300 | //Load the value in ACCU 1-L. |
| +AR1 |  | //Add ACCU 1-L (integer, 16 bit) to AR2. |

## Example 2

| STL | Explanation |  |
| :--- | :--- | :--- |
| +AR1 | P\#300.0 | //Add the offset 30.0 to AR2. |

### 14.13 BLD Program Display Instruction (Null)

## Format

## BLD <number>

| Address | Description |
| :--- | :--- |
| <number> | Number specifies BLD instruction, range from 0 to 255 |

## Description

BLD <number> (program display instruction; null instruction) executes no function and does not affect the status bits. The instruction is used for the programming device (PG) for graphic display. It is created automatically when a Ladder or FBD program is displayed in STL. The address <number> specifies the BLD instruction and is generated by the programming device.

## Status word

### 14.14 NOP 0 Null Instruction

## Format

## NOP 0

## Description

NOP 0 (Instruction NOP with address "0") executes no function and does not affect the status bits. The instruction code contains a bit pattern with 16 zeros. The instruction is of interest only to the programming device (PG) when a program is displayed.

## Status word

|  | BR | CC 1 | CC 0 | OV | OS | OR | STA | RLO | IFC |

### 14.15 NOP 1 Null Instruction

## Format

## NOP 1

## Description

NOP 1 (Instruction NOP with address "1") executes no function and does not affect the status bits. The instruction code contains a bit pattern with 16 ones. The instruction is of interest only to the programming device (PG) when a program is displayed.

## Status word

## A Overview of All STL Instructions

## A. 1 STL Instructions Sorted According to German Mnemonics (SIMATIC)

| German Mnemonics | English Mnemonics | Program Elements Catalog | Description |
| :---: | :---: | :---: | :---: |
| + | + | Integer math Instruction | Add Integer Constant (16, 32-Bit) |
| $=$ | $=$ | Bit logic Instruction | Assign |
| ) | ) | Bit logic Instruction | Nesting Closed |
| +AR1 | +AR1 | Accumulator | AR1 Add ACCU 1 to Address Register 1 |
| +AR2 | +AR2 | Accumulator | AR2 Add ACCU 1 to Address Register 2 |
| +D | +D | Integer math Instruction | Add ACCU 1 and ACCU 2 as Double Integer (32-Bit) |
| -D | -D | Integer math Instruction | Subtract ACCU 1 from ACCU 2 as Double Integer (32-Bit) |
| *D | *D | Integer math Instruction | Multiply ACCU 1 and ACCU 2 as Double Integer (32-Bit) |
| ID | /D | Integer math Instruction | Divide ACCU 2 by ACCU 1 as Double Integer (32-Bit) |
| ? D | ? D | Compare | Compare Double Integer (32-Bit) $==,<>,>,<,>=,<=$ |
| $+1$ | + | Integer math Instruction | Add ACCU 1 and ACCU 2 as Integer (16-Bit) |
| -1 | -1 | Integer math Instruction | Subtract ACCU 1 from ACCU 2 as Integer (16-Bit) |
| * | * | Integer math Instruction | Multiply ACCU 1 and ACCU 2 as Integer (16-Bit) |
| / | /I | Integer math Instruction | Divide ACCU 2 by ACCU 1 as Integer (16-Bit) |
| ? 1 | ? 1 | Compare | Compare Integer (16-Bit) ==, <>, >, <, >=, <= |
| +R | +R | Floating point Instruction | Add ACCU 1 and ACCU 2 as a Floating-Point Number (32-Bit IEEE-FP) |
| -R | -R | Floating point Instruction | Subtract ACCU 1 from ACCU 2 as a Floating-Point Number (32-Bit IEEE-FP) |
| *R | *R | Floating point Instruction | Multiply ACCU 1 and ACCU 2 as Floating-Point Numbers (32-Bit IEEE-FP) |
| /R | /R | Floating point Instruction | Divide ACCU 2 by ACCU 1 as a Floating-Point Number (32-Bit IEEE-FP) |

| German Mnemonics | English Mnemonics | Program Elements Catalog | Description |
| :---: | :---: | :---: | :---: |
| ? R | ? R | Compare | Compare Floating-Point Number (32-Bit) $==,<>,>,<,>=$, <= |
| ABS | ABS | Floating point Instruction | Absolute Value of a Floating-Point Number (32-Bit IEEE-FP) |
| ACOS | ACOS | Floating point Instruction | Generate the Arc Cosine of a Floating-Point Number (32-Bit) |
| ASIN | ASIN | Floating point Instruction | Generate the Arc Sine of a Floating-Point Number (32-Bit) |
| ATAN | ATAN | Floating point Instruction | Generate the Arc Tangent of a Floating-Point Number (32-Bit) |
| AUF | OPN | DB call | Open a Data Block |
| BE | BE | Program control | Block End |
| BEA | BEU | Program control | Block End Unconditional |
| BEB | BEC | Program control | Block End Conditional |
| BLD | BLD | Program control | Program Display Instruction (Null) |
| BTD | BTD | Convert | BCD to Integer (32-Bit) |
| BTI | BTI | Convert | BCD to Integer (16-Bit) |
| CALL | CALL | Program control | Block Call |
| CALL | CALL | Program control | Call Multiple Instance |
| CALL | CALL | Program control | Call Block from a Library |
| CC | CC | Program control | Conditional Call |
| CLR | CLR | Bit logic Instruction | Clear RLO (=0) |
| cos | cos | Floating point Instruction | Generate the Cosine of Angles as Floating-Point Numbers (32-Bit) |
| DEC | DEC | Accumulator | Decrement ACCU 1-L-L |
| DTB | DTB | Convert | Double Integer (32-Bit) to BCD |
| DTR | DTR | Convert | Double Integer (32-Bit) to Floating-Point (32-Bit IEEE-FP) |
| ENT | ENT | Accumulator | Enter ACCU Stack |
| EXP | EXP | Floating point Instruction | Generate the Exponential Value of a Floating-Point Number (32-Bit) |
| FN | FN | Bit logic Instruction | Edge Negative |
| FP | FP | Bit logic Instruction | Edge Positive |
| FR | FR | Counters | Enable Counter (Free)_(free, FR C 0 to C 255) |
| FR | FR | Timers | Enable Timer (Free) |
| INC | INC | Accumulator | Increment ACCU 1-L-L |

| German Mnemonics | English Mnemonics | Program Elements Catalog | Description |
| :---: | :---: | :---: | :---: |
| INVD | INVD | Convert | Ones Complement Double Integer (32-Bit) |
| INVI | INVI | Convert | Ones Complement Integer (16-Bit) |
| ITB | ITB | Convert | Integer (16-Bit) to BCD |
| ITD | ITD | Convert | Integer (16-Bit) to Double Integer (32-Bit) |
| L | L | Load/Transfer | Load |
| L DBLG | L DBLG | Load/Transfer | Load Length of Shared DB in ACCU 1 |
| L DBNO | L DBNO | Load/Transfer | Load Number of Shared DB in ACCU 1 |
| L DILG | L DILG | Load/Transfer | Load Length of Instance DB in ACCU 1 |
| L DINO | L DINO | Load/Transfer | Load Number of Instance DB in ACCU 1 |
| L STW | L STW | Load/Transfer | Load Status Word into ACCU 1 |
| L | L | Load/Transfer | Load Current Timer Value into ACCU 1 as Integer_(the current timer value can be a number from 0 to 255 , for example, L T 32) |
| L | L | Load/Transfer | Load Current Counter Value into ACCU 1_(the current counter value can be a number from 0 to 255 , for example, L C 15) |
| LAR1 | LAR1 | Load/Transfer | Load Address Register 1 from ACCU 1 |
| LAR1 | LAR1 | Load/Transfer | Load Address Register 1 with Double Integer (32-Bit Pointer) |
| LAR1 | LAR1 | Load/Transfer | Load Address Register 1 from Address Register 2 |
| LAR2 | LAR2 | Load/Transfer | Load Address Register 2 from ACCU 1 |
| LAR2 | LAR2 | Load/Transfer | Load Address Register 2 with Double Integer (32-Bit Pointer) |
| LC | LC | Counters | Load Current Counter Value into ACCU 1 as BCD_(the current timer value can be a number from 0 to 255 , for example, LC C 15) |
| LC | LC | Timers | Load Current Timer Value into ACCU 1 as $B C D$ _the current counter value can be a number from 0 to 255 , for example, LC T 32) |
| LEAVE | LEAVE | Accumulator | Leave ACCU Stack |
| LN | LN | Floating point Instruction | Generate the Natural Logarithm of a Floating-Point Number (32-Bit) |
| LOOP | LOOP | Jumps | Loop |
| MCR( | MCR( | Program control | Save RLO in MCR Stack, Begin MCR |
| )MCR | )MCR | Program control | End MCR |
| MCRA | MCRA | Program control | Activate MCR Area |
| MCRD | MCRD | Program control | Deactivate MCR Area |
| MOD | MOD | Integer math Instruction | Division Remainder Double Integer (32-Bit) |
| NEGD | NEGD | Convert | Twos Complement Double Integer (32-Bit) |

| German Mnemonics | English Mnemonics | Program Elements Catalog | Description |
| :---: | :---: | :---: | :---: |
| NEGI | NEGI | Convert | Twos Complement Integer (16-Bit) |
| NEGR | NEGR | Convert | Negate Floating-Point Number (32-Bit, IEEE-FP) |
| NOP 0 | NOP 0 | Accumulator | Null Instruction |
| NOP 1 | NOP 1 | Accumulator | Null Instruction |
| NOT | NOT | Bit logic Instruction | Negate RLO |
| 0 | O | Bit logic Instruction | Or |
| O( | O( | Bit logic Instruction | Or with Nesting Open |
| OD | OD | Word logic Instruction | OR Double Word (32-Bit) |
| ON | ON | Bit logic Instruction | Or Not |
| ON( | ON( | Bit logic Instruction | Or Not with Nesting Open |
| OW | OW | Word logic Instruction | OR Word (16-Bit) |
| POP | POP | Accumulator | POP |
| POP | POP | Accumulator | CPU with Two ACCUs |
| POP | POP | Accumulator | CPU with Four ACCUs |
| PUSH | PUSH | Accumulator | CPU with Two ACCUs |
| PUSH | PUSH | Accumulator | CPU with Four ACCUs |
| R | R | Bit logic Instruction | Reset |
| R | R | Counters | Reset Counter_(the current counter can be a number from 0 to 255, for example, R C 15) |
| R | R | Timers | Reset Timer_(the current timer can be a number from 0 to 255, for example, R T 32) |
| RLD | RLD | Shift/Rotate | Rotate Left Double Word (32-Bit) |
| RLDA | RLDA | Shift/Rotate | Rotate ACCU 1 Left via CC 1 (32-Bit) |
| RND | RND | Convert | Round |
| RND+ | RND+ | Convert | Round to Upper Double Integer |
| RND- | RND- | Convert | Round to Lower Double Integer |
| RRD | RRD | Shift/Rotate | Rotate Right Double Word (32-Bit) |
| RRDA | RRDA | Shift/Rotate | Rotate ACCU 1 Right via CC 1 (32-Bit) |
| S | S | Bit logic Instruction | Set |
| S | S | Counters | Set Counter Preset Value_(the current counter can be a number from 0 to 255, for example, S C 15) |
| SA | SF | Timers | Off-Delay Timer |
| SAVE | SAVE | Bit logic Instruction | Save RLO in BR Register |
| SE | SD | Timers | On-Delay Timer |

| German <br> Mnemonics | English <br> Mnemonics | Program <br> Elements <br> Catalog | Description |
| :--- | :--- | :--- | :--- |
| SET | SET | Bit logic <br> Instruction | Set |
| SI | SP | Timers | Pulse Timer |
| SIN | Floating point <br> Instruction | Generate the Sine of Angles as Floating-Point Numbers <br> (32-Bit) |  |
| SLD | SLD | Shift/Rotate | Shift Left Double Word (32-Bit) |
| SLW | Shift/Rotate | Shift Left Word (16-Bit) |  |
| SPA | Jumps | Jump Unconditional |  |
| SPB | JC | Jumps | Jump if RLO = 1 |
| SPBB | JCB | Jumps | Jump if RLO = 1 with BR |
| SPBI | JBI | Jumps | Jump if BR = 1 |
| SPBIN | JNBI | Jumps | Jump if BR = 0 |
| SPBN | JCN | Jumps | Jump if RLO = 0 |
| SPBNB | JNB | Jumps | Jump if RLO = 0 with BR |
| SPL | JL | Jumps | Jump to Labels |
| SPM | JM | Jumps | Jump if Minus |

| L | L | Timers | Load Current Timer Value into ACCU 1 as Integer_(the current timer value can be a number from 0 to 255 , for example, L T 32) |
| L | L | Counters | Load Current Counter Value into ACCU 1_(the current counter value can be a number from 0 to 255 , for example, L C 15) |
| LAR1 | LAR1 | Load/Transfer | Load Address Register 1 from ACCU 1 |
| LAR1 <D> | LAR1<D> | Load/Transfer | Load Address Register 1 with Double Integer (32-Bit Pointer) |
| LAR1 AR2 | LAR1 AR2 | Load/Transfer | Load Address Register 1 from Address Register 2 |
| LAR2 | LAR2 | Load/Transfer | Load Address Register 2 from ACCU 1 |
| LAR2 <D> | LAR2 <D> | Load/Transfer | Load Address Register 2 with Double Integer (32-Bit Pointer) |

| English Mnemonics | German Mnemonics | Program Elements Catalog | Description |
| :---: | :---: | :---: | :---: |
| LC | LC | Counters | Load Current Counter Value into ACCU 1 as $B C D$ (the current timer value can be a number from 0 to 255 , for example, LC C 15) |
| LC | LC | Timers | Load Current Timer Value into ACCU 1 as BCD_(the current counter value can be a number from 0 to 255 , for example, LC T 32) |
| LEAVE | LEAVE | Accumulator | Leave ACCU Stack |
| LN | LN | Floating point Instruction | Generate the Natural Logarithm of a Floating-Point Number (32-Bit) |
| LOOP | LOOP | Jumps | Loop |
| MCR( | MCR( | Program control | Save RLO in MCR Stack, Begin MCR |
| )MCR | )MCR | Program control | End MCR |
| MCRA | MCRA | Program control | Activate MCR Area |
| MCRD | MCRD | Program control | Deactivate MCR Area |
| MOD | MOD | Integer math Instruction | Division Remainder Double Integer (32-Bit) |
| NEGD | NEGD | Convert | Twos Complement Double Integer (32-Bit) |
| NEGI | NEGI | Convert | Twos Complement Integer (16-Bit) |
| NEGR | NEGR | Convert | Negate Floating-Point Number (32-Bit, IEEE-FP) |
| NOP 0 | NOP 0 | Accumulator | Null Instruction |
| NOP 1 | NOP 1 | Accumulator | Null Instruction |
| NOT | NOT | Bit logic Instruction | Negate RLO |
| 0 | 0 | Bit logic Instruction | Or |
| O( | O( | Bit logic Instruction | Or with Nesting Open |
| OD | OD | Word logic Instruction | OR Double Word (32-Bit) |
| ON | ON | Bit logic Instruction | Or Not |
| ON( | ON( | Bit logic Instruction | Or Not with Nesting Open |
| OPN | AUF | DB call | Open a Data Block |
| OW | OW | Word logic Instruction | OR Word (16-Bit) |
| POP | POP | Accumulator | POP |
| POP | POP | Accumulator | CPU with Two ACCUs |
| POP | POP | Accumulator | CPU with Four ACCUs |
| PUSH | PUSH | Accumulator | CPU with Two ACCUs |
| PUSH | PUSH | Accumulator | CPU with Four ACCUs |
| R | R | Bit logic Instruction | Reset |
| R | R | Counters | Reset Counter_(the current counter can be a number from 0 to 255, for example, R C 15) |

| English Mnemonics | German Mnemonics | Program Elements Catalog | Description |
| :---: | :---: | :---: | :---: |
| R | R | Timers | Reset Timer_(the current timer can be a number from 0 to 255, for example, R T 32) |
| RLD | RLD | Shift/Rotate | Rotate Left Double Word (32-Bit) |
| RLDA | RLDA | Shift/Rotate | Rotate ACCU 1 Left via CC 1 (32-Bit) |
| RND | RND | Convert | Round |
| RND- | RND- | Convert | Round to Lower Double Integer |
| RND+ | RND+ | Convert | Round to Upper Double Integer |
| RRD | RRD | Shift/Rotate | Rotate Right Double Word (32-Bit) |
| RRDA | RRDA | Shift/Rotate | Rotate ACCU 1 Right via CC 1 (32-Bit) |
| S | S | Bit logic Instruction | Set |
| S | S | Counters | Set Counter Preset Value_(the current counter can be a number from 0 to 255, for example, S C 15) |
| SAVE | SAVE | Bit logic Instruction | Save RLO in BR Register |
| SD | SE | Timers | On-Delay Timer |
| SE | SV | Timers | Extended Pulse Timer |
| SET | SET | Bit logic Instruction | Set |
| SF | SA | Timers | Off-Delay Timer |
| SIN | SIN | Floating point Instruction | Generate the Sine of Angles as Floating-Point Numbers (32-Bit) |
| SLD | SLD | Shift/Rotate | Shift Left Double Word (32-Bit) |
| SLW | SLW | Shift/Rotate | Shift Left Word (16-Bit) |
| SP | SI | Timers | Pulse Timer |
| SQR | SQR | Floating point Instruction | Generate the Square of a Floating-Point Number (32-Bit) |
| SQRT | SQRT | Floating point Instruction | Generate the Square Root of a Floating-Point Number (32-Bit) (32-Bit) |
| SRD | SRD | Shift/Rotate | Shift Right Double Word (32-Bit) |
| SRW | SRW | Shift/Rotate | Shift Right Word (16-Bit) |
| SS | SS | Timers | Retentive On-Delay Timer |
| SSD | SSD | Shift/Rotate | Shift Sign Double Integer (32-Bit) |

## B Programming Examples

## B. 1 Overview of Programming Examples

## Practical Applications

Each statement list instruction triggers a specific operation. When you combine these instructions into a program, you can accomplish a wide variety of automation tasks. This chapter provides the following examples of practical applications of the statement list instructions:

- Controlling a conveyor belt using bit logic instructions
- Detecting direction of movement on a conveyor belt using bit logic instructions
- Generating a clock pulse using timer instructions
- Keeping track of storage space using counter and comparison instructions
- Solving a problem using integer math instructions
- Setting the length of time for heating an oven

## Instructions Used

| Mnemonic | Program Elements Catalog | Description |
| :--- | :--- | :--- |
| AW | Word logic instruction | And Word |
| OW | Word logic instruction | Or Word |
| CD, CU | Counters | Counter Down, Counter Up |
| S, R | Bit logic instruction | Set, Reset |
| NOT | Bit logic instruction | Negate RLO |
| FP | Bit logic instruction | Edge Positive |
| +I | Floating-Point instruction | Add Accumulators 1 and 2 as Integer |
| /I | Floating-Point instruction | Divide Accumulator 2 by Accumulator 1 as <br> Integer |
| *I | Floating-Point instruction | Multiply Accumulators 1 and 2 as Integers |
| $>=$ I, <=I | Compare | Compare Integer |
| A, AN | Bit logic instruction | And, And Not |
| O, ON | Bit logic instruction | Or, Or Not |
| $=$ | Bit logic instruction | Assign |
| INC | Accumulator | Increment Accumulator 1 |
| BE, BEC | Program Control | Block End and Block End Conditional |
| L, T | Load / Transfer | Load and Transfer |
| SE | Timers | Extended Pulse Timer |

## B. 2 Example: Bit Logic Instructions

## Example 1: Controlling a Conveyor Belt

The following figure shows a conveyor belt that can be activated electrically. There are two push button switches at the beginning of the belt: S1 for START and S2 for STOP. There are also two push button switches at the end of the belt: S3 for START and S4 for STOP. It is possible to start or stop the belt from either end. Also, sensor S5 stops the belt when an item on the belt reaches the end.

## Absolute and symbolic Programming

You can write a program to control the conveyor belt using absolute values or symbols that represent the various components of the conveyor system.

You need to make a symbol table to correlate the symbols you choose with absolute values (see the STEP 7 Online Help).

| System Component | Absolute Address | Symbol | Symbol Table |
| :---: | :---: | :---: | :---: |
| Push Button Start Switch | 11.1 | S1 | 11.1 S1 |
| Push Button Stop Switch | 11.2 | S2 | 11.2 S2 |
| Push Button Start Switch | 11.3 | S3 | 11.3 S3 |
| Push Button Stop Switch | 11.4 | S4 | 11.4 S4 |
| Sensor | 11.5 | S5 | 11.5 S5 |
| Motor | Q 4.0 | MOTOR_ON | Q 4.0 MOTOR_ON |

| Absolute Program | Symbolic Program |  |
| :--- | :--- | :--- |
| O | I 1.1 | O |
| O | I 1.3 |  |
| S | Q 4.0 | O |
| S3 |  |  |
| O | I 1.2 | S |
| O MOTOR_ON |  |  |
| ON | I 1.4 | O |
| R | Q 4.0 | S2 |

## Statement List to control the Conveyor Belt

```
STL Explanation
O I 1.1 //Pressing either start switch turns the motor on.
O I 1.3
S Q 4.0
O I 1.2 //Pressing either stop switch or opening the normally closed contact at the
O I 1.4
ON I 1.5
```

Example 2: Detecting the Direction of a Conveyor Belt
The following figure shows a conveyor belt that is equipped with two photoelectric barriers (PEB1 and PEB2) that are designed to detect the direction in which a package is moving on the belt. Each photoelectric light barrier functions like a normally open contact.

## Absolute and symbolic Programming

You can write a program to activate a direction display for the conveyor belt system using absolute values or symbols that represent the various components of the conveyor system.

You need to make a symbol table to correlate the symbols you choose with absolute values (see the STEP 7 Online Help).

| System Component | Absolute Address | Symbol | Symbol Table |  |
| :--- | :--- | :--- | :--- | :--- |
| Photoelectric barrier 1 | I 0.0 | PEB1 | I 0.0 | PEB1 |
| Photoelectric barrier 2 | I 0.1 | PEB2 | I 0.1 | PEB2 |
| Display for movement to <br> right | Q 4.0 | RIGHT | Q 4.0 | RIGHT |
| Display for movement to left | Q 4.1 | LEFT | Q 4.1 | LEFT |
| Pulse memory bit 1 | M 0.0 | PMB1 | M 0.0 | PMB1 |
| Pulse memory bit 2 | M 0.1 | PMB2 | M 0.1 | PMB2 |

| Absolute Program | Symbolic Program |  |  |
| :--- | :--- | :--- | :--- |
| A | I 0.0 | A | PEB1 |
| FP | M 0.0 | FP | PMB1 |
| AN | 10.1 | AN | PEB 2 |
| S | Q 4.1 | S | LEFT |
| A | 10.1 | A | PEB 2 |
| FP | M 0.1 | FP | PMB 2 |
| AN | 10.0 | AN | PEB 1 |
| S | Q 4.0 | S | RIGHT |
| AN | 10.0 | AN | PEB 1 |
| AN | 10.1 | AN | PEB 2 |
| R | Q 4.0 | R | RIGHT |
| R | Q 4.1 | R | LEFT |

## Statement List

| STL |  | Explanation |
| :---: | :---: | :---: |
| A |  | //If there is a transition in signal state from 0 to 1 (positive edge) at input I 0.0 and, at the same time, the signal state at input 10.1 is 0 , then the package on the belt is moving to the left. |
| FP | M 0.0 |  |
| AN | I 0.1 |  |
| S | Q 4.1 |  |
| A | I 0.1 | //If there is a transition in signal state from 0 to 1 (positive edge) at input I 0.1 and, at the same time, the signal state at input I 0.0 is 0 , then the package on the belt is moving to the right. If one of the photo-electric light barriers is broken, this means that there is a package between the barriers. |
| FP | M 0.1 |  |
| AN | I 0.0 |  |
| S | Q 4.0 |  |
| AN | I 0.0 | //If neither photoelectric barrier is broken, then there is no package between the barriers. The direction pointer shuts off. |
| AN | I 0.1 |  |
| R | Q 4.0 |  |
| R | Q 4.1 |  |

## B. 3 Example: Timer Instructions

## Clock Pulse Generator

You can use a clock pulse generator or flasher relay when you need to produce a signal that repeats periodically. A clock pulse generator is common in a signalling system that controls the flashing of indicator lamps.

When you use the S7-300, you can implement the clock pulse generator function by using time-driven processing in special organization blocks. The example shown in the following statement list, however, illustrates the use of timer functions to generate a clock pulse. The sample program shows how to implement a freewheeling clock pulse generator by using a timer.

## Statement List to Generate a Clock Pulse (pulse duty factor 1:1)

| STL | Explanation |  |
| :--- | :--- | :--- |
| U T1 | //If timer T 1 has expired, |  |
| L | S5T\#250ms | //load the time value 250 ms into T 1 and |
| SV | T1 | //start T 1 as an extended-pulse timer. |
| NOT | //Negate (invert) the result of logic operation. |  |
| BEB | //If the timer is running, end the current block. |  |
| L MB100 | //If the timer has expired, load the contents of memory byte MB100, |  |
| INC 1 | //increment the contents by 1, |  |
| T MB100 | //and transfer the result to memory byte MB100. |  |

## Signal Check

A signal check of timer T1 produces the following result of logic operation (RLO).

As soon as the time runs out, the timer is restarted. Because of this, the signal check made the statement AN T1 produces a signal state of 1 only briefly.

The negated (inverted) RLO:

Every 250 ms the RLO bit is 0 . Then the BEC statement does not end the processing of the block. Instead, the contents of memory byte MB100 is incremented by 1.

The contents of memory byte MB100 changes every 250 ms as follows:

```
0 -> 1 -> 2 -> 3 -> ... -> 254 -> 255 -> 0 -> 1 ...
```

## Achieving a Specific Frequency

From the individual bits of memory byte MB100 you can achieve the following frequencies:

| Bits of MB100 | Frequency in Hertz | Duration |  |
| :---: | :---: | :---: | :---: |
| M 100.0 | 2.0 | 0.5 s | (250 ms on / 250 ms off) |
| M 100.1 | 1.0 | 1 s | ( $0.5 \mathrm{~s} \mathrm{on} / 0.5 \mathrm{~s}$ off) |
| M 100.2 | 0.5 | 2 s | (1 s on / 1 s off) |
| M 100.3 | 0.25 | 4 s | ( 2 s on / 2 s off) |
| M 100.4 | 0.125 | 8 s | (4 s on / $4 \mathrm{~s} \mathrm{off)}$ |
| M 100.5 | 0.0625 | 16 s | (8 s on / $8 \mathrm{~s} \mathrm{off)}$ |
| M 100.6 | 0.03125 | 32 s | (16 s on / 16 s off) |
| M 100.7 | 0.015625 | 64 s | (32 s on / $32 \mathrm{~s} \mathrm{off)}$ |

## Statement List

| STL | Explanation |  |
| :--- | :--- | :--- |
| A | M10.0 | //M 10.0 $=1$ when a fault occurs. The fault lamp blinks at a frequency of 1 |
| A | M100.1 | Hz when a fault occurs. |
| $=$ | Q 4.0 |  |

Signal states of the Bits of Memory MB 101

Signal state of Bit 1 of MB 101 (M 101.1)
Frequency $=1 / \mathrm{T}=1 / 1 \mathrm{~s}=1 \mathrm{~Hz}$

## B. 4 Example: Counter and Comparison Instructions

## Storage Area with Counter and Comparator

The following figure shows a system with two conveyor belts and a temporary storage area in between them. Conveyor belt 1 delivers packages to the storage area. A photoelectric barrier at the end of conveyor belt 1 near the storage area determines how many packages are delivered to the storage area. Conveyor belt 2 transports packages from the temporary storage area to a loading dock where trucks take the packages away for delivery to customers. A photoelectric barrier at the end of conveyor belt 2 near the storage area determines how many packages leave the storage area to go to the loading dock. A display panel with five lamps indicates the fill level of the temporary storage area.

## Statement List that Activates the Indicator Lamps on the Display Panel

```
STL Explanation 
Cu C1 //increases the count value of counter C 1 by one, thereby counting the number
    of packages going into the storage area.
    //
A I 0.1 //Each pulse generated by photoelectric barrier 2
CD C1 //decreases the count value of counter C 1 by one, thereby counting the
    packages that leave the storage area.
    //
AN C1 //If the count value is 0,
= Q 4.0 //the indicator lamp for "Storage area empty" comes on.
    //
A C1 //If the count value is not 0,
= A 4.1 //the indicator lamp for "Storage area not empty" comes on.
    //
L 50
L C1
<=I //If 50 is less than or equal to the count value,
= Q 4.2 //the indicator lamp for "Storage area 50% full" comes on.
    Q //
    90
>=I //If the count value is greater than or equal to 90,
= Q 4.3 //the indicator lamp for "Storage area 90% full" comes on.
    //
L Z1
L 100
>=I //If the count value is greater than or equal to 100,
= Q 4.4 //the indicator lamp for "Storage area filled to capacity" comes on. (You could
    also use output Q 4.4 to lock conveyor belt 1.)
```

## B. 5 Example: Integer Math Instructions

## Solving a Math Problem

The sample program shows you how to use three integer math instructions to produce the same result as the following equation:

MD4 $=(($ IW0 + DBW3 $) \times 15) / \mathrm{MW} 2$

## Statement List

| STL |  | Explanation |
| :---: | :---: | :---: |
| L | EW0 | //Load the value from input word IW0 into accumulator 1. |
| L | DB5. DBW3 | //Load the value from shared data word DBW3 of DB5 into accumulator 1. The old contents of accumulator 1 are shifted to accumulator 2. |
| +I | I 0.1 | //Add the contents of the low words of accumulators 1 and 2. The result is stored in the low word of accumulator 1 . The contents of accumulator 2 and the high word of accumulator 1 remain unchanged. |
| L | +15 | $/ /$ Load the constant value +15 into accumulator 1 . The old contents of accumulator 1 are shifted to accumulator 2. |
| *I |  | //Multiply the contents of the low word of accumulator 2 by the contents of the low word of accumulator 1. The result is stored in accumulator <br> 1. The contents of accumulator 2 remain unchanged. |
| L | MW2 | //Load the value from memory word MW2 into accumulator 1. The old contents of accumulator 1 are shifted to accumulator 2. |
| /I |  | //Divide the contents of the low word of accumulator 2 by the contents of the low word of accumulator 1. The result is stored in accumulator <br> 1. The contents of accumulator 2 remain unchanged. |
| T | MD4 | //Transfer the final result to memory double word MD4. The contents of both accumulators remain unchanged. |

## B. 6 Example: Word Logic Instructions

## Heating an Oven

The operator of the oven starts the oven heating by pushing the start push button. The operator can set the length of time for heating by using the thumbwheel switches shown in the figure. The value that the operator sets indicates seconds in binary coded decimal (BCD) format.

| System Component | Absolute Address |
| :--- | :--- |
| Start Push Button | I 0.7 |
| Thumbwheel for ones | I 1.0 to I 1.3 |
| Thumbwheel for tens | I 1.4 to I 1.7 |
| Thumbwheel for hundreds | I 0.0 to I 0.3 |
| Heating starts | Q 4.0 |

## Statement List

| STL |  | Explanation |
| :---: | :---: | :---: |
| A | T1 | //If the timer is running, |
| = | Q 4.0 | //then turn on the heat. |
| BEC |  | //If the timer is running, then end processing here. This prevents timer T1 from being restarted if the push button is pressed. |
| L | IW0 |  |
| AW | W\#16\#0FFF | //Mask input bits 10.4 through I 0.7 (that is, reset them to 0). The time value in seconds is in the low word of accumulator 1 in binary coded decimal format. |
| OW | W\#16\#2000 | Assign the time base as seconds in bits 12 and 13 of the low word of accumulator 1. |
| A | I 0.7 |  |
| SE | T1 | //Start timer T1 as an extended pulse timer if the push button is pressed. |

## C Parameter Transfer

The parameters of a block are transferred as a value. With function blocks a copy of the actual parameter value in the instance data block is used in the called block. With functions a copy of the actual value lies in the local data stack. Pointers are not copied. Prior to the call the INPUT values are copied into the instance DB or to the L stack. After the call the OUTPUT values are copied back into the variables. Within the called block you can only work on a copy. The STL instructions required for this are in the calling block and remain hidden from the user.

## Note

If memory bits, inputs, outputs or peripheral I/Os are used as actual address of a function they are treated in a different way than the other addresses. Here, updates are carried out directly, not via L Stack.

## Caution

When programming the called block, ensure that the parameters declared as OUTPUT are also written. Otherwise the values output are random! With function blocks the value will be the value from the instance DB noted by the last call, with functions the value will be the value which happens to be in the $L$ stack.
Note the following points:

- Initialize all OUTPUT parameters if possible.
- Try not to use any Set and Reset instructions. These instructions are dependent on the RLO. If the RLO has the value 0 , the random value will be retained.
- If you jump within the block, ensure that you do not skip any locations where OUTPUT parameters are written. Do not forget BEC and the effect of the MCR instructions.
